*From AEPW To MPS*

*For 400 MW*  
*From 1/1/2004 To 1/1/2005*

*SPP Engineering, Tariff Studies*

## **System Impact Study**

Exelon Generation Company, LLC has requested a system impact study for long-term Firm Point-to-Point transmission service from AEPW to MPS for 400 MW. The period of the service requested is from 1/1/2004 to 1/1/2005. The OASIS reservation number is 576130. This study is being performed to provide preliminary results for the potential redirect of firm service from AEPW to AMRN. The AEPW to AMRN firm service was renewed from 1/1/2004 to 1/1/2005 for an amount of 265MW. Therefore, the study for the potential redirect of this service was performed for an amount of 265 MW. The principal objective of this study is to identify system constraints on the SPP Regional Tariff System and potential system facility upgrades that may be necessary to provide the requested service.

The AEPW to MPS request was studied to determine the facility upgrades required based on the actual queue position of the request. Only the higher priority requests in Facility Study mode were considered in developing the study models. The results of the transfer analysis are documented in Table 1. The results given in Table 1 include upgrades that may be assigned to higher priority requests. The results of this study gives the customer an estimated cost of the facility upgrades that may be required in order to accommodate the AEPW to MPS request for redirected service. At the customer's request, an additional analysis was performed to determine the impacts of redirecting confirmed ERCOTE to EES service to the requested path of AEPW to MPS. The results of this analysis are documented in Table 2. The AEPW to MPS transfer has a greater impact on all originally identified facilities than the ERCOTE to EES original request.

Eight seasonal models were used to study the AEPW to MPS request for the requested service period. The SPP 2003 Series Cases 2003/04 Winter Peak (03WP), 2004 April Minimum (04AP), 2004 Spring Peak (04G), 2004 Summer Peak (04SP), 2004 Fall Peak (04FA), 2004/05 Winter Peak (04WP), 2009 Summer Peak (09SP) and 2009/10 Winter Peak (09WP) were used to study the impact of the request on the SPP system. The chosen base case models were modified to reflect the most current modeling information. The cases were modified to reflect firm transfers during the requested service period that were not already included in the January 2003 base case series models.

PTI's MUST First Contingency Incremental Transfer Capability (FCITC) DC analysis was used to study the request. The MUST options chosen to conduct the System Impact Study analysis can be found in Appendix A. The MUST option to convert MVA branch ratings to estimated MW ratings was used to partially compensate for reactive loading.

The study results of the SPS to MPS transfer show that limiting constraints exist. Due to the limiting constraints identified, the Transmission Service Request cannot be granted. Any solutions, upgrades, and costs provided in the System Impact Study are planning estimates only. The final ATC and upgrades required may vary from these results due to the status of higher priority requests, unknown facility upgrades and proposed transmission plans that will be identified during the facility study process, and the final results of the full AC analysis. Execution of a Facility Study Agreement is now required to maintain queue position. The final upgrade solutions and cost assignments will be determined upon the completion of the facility study.

This study was performed in order to provide estimated upgrades required for a potential redirect of service. If an actual redirect of service is desired, a request must be made on OASIS that designates the Request Type as a redirect of confirmed service. After the request for redirect is made, another study must be performed based on the actual queue position of the new request.

**Table 1** – SPP facility overloads identified for the CSWS to MPS transfer as a redirect of CSWS to AMRN service

Note: The Total Estimated Cost for Table 1 and Table 2 are independent of each other.

## **Appendix A**

### MUST CHOICES IN RUNNING FCITC DC ANALYSIS

#### CONSTRAINTS/CONTINGENCY INPUT OPTIONS

1. AC Mismatch Tolerance – 2 MW
2. Base Case Rating – Rate A
3. Base Case % of Rating – 100%
4. Contingency Case Rating – Rate B
5. Contingency Case % of Rating – 100%
6. Base Case Load Flow – PSS/E
7. Convert branch ratings to estimated MW ratings – Yes
8. Contingency ID Reporting – Labels
9. Maximum number of contingencies to process - 50000

#### MUST CALCULATION OPTIONS

1. Phase Shifters Model for DC Linear Analysis – Constant flow for Base Case and Contingencies
2. Report Base Case Violations with FCITC – Yes
3. Maximum number of violations to report in FCITC table - 50000
4. Distribution Factor (OTDF and PTDF) Cutoff – 0.0
5. Maximum times to report the same elements - 10
6. Apply Distribution Factor to Contingency Analysis – Yes
7. Apply Distribution Factor to FCITC Reports – Yes
8. Minimum Contingency Case flow change – 1 MW
9. Minimum Contingency Case Distribution Factor change – 0.0
10. Minimum Distribution Factor for Transfer Sensitivity Analysis – 0.0
