SECTION 5: POWER FACTOR ANALYSIS

The objective of this task is to quantify the power factor at the point of interconnection for the wind farms during base case and system contingencies. SPP transmission planning practice requires interconnecting generation projects to maintain the power factor (pf) at the Point of Interconnection (POI) within +/- 0.95 pf for system intact conditions and for post-contingency conditions. This is analyzed by having the wind farm maintain a prescribed voltage schedule at the point of interconnection of 1.0 p.u. voltage.

The 2016 Winter Peak, 2017 Summer Peak, 2020 Summer Peak, 2020 Winter Peak, and 2025 Summer Peak power flows provided by SPP were examined prior to the Power Factor Analysis to ensure they contained the proposed study project modeled at 100% of the nameplate rating and any previously queued projects listed in Table 2-2. There was no suspect power flow data in the study area. The proposed study project and any previously queued projects at the same point of interconnection were turned off during the power factor analysis. The wind farm(s) were then replaced by a generator modeled at the high side bus with the same real power (MW) capability as the wind farm(s) and open limits for the reactive power set points (Mvar). The generator was set to hold the POI scheduled bus voltage. All N-1, three-phase fault contingencies from Table 2-3 were then applied and the reactive power required to maintain the bus voltage was recorded.

5.1 Approach

The upgrades that were identified in the Stability Analysis were implemented to each power case for the power factor analysis. Refer to Section 3 for the necessary upgrades and Table 5-1 for the scheduled voltage each study generator was set to hold at the point of interconnection for each season.

GEN-2015-018 was disabled and a generator was placed at the study project's high side bus. The generator was modeled with PGEN = 80.0 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to GEN-2015-018 were disabled.

GEN-2015-033 and GEN-2014-074 were disabled in the power flow case. A generator was placed at the high side bus of GEN-2015-033 and modeled with PGEN = 152 MW, Qmin = -9999 Mvar, Qmax = 9999 Mvar. A second generator was placed at the high side bus of GEN-2014-074 and modeled with PGEN = 152 MW, Qmin = -9999 Mvar, Qmax = 9999 Mvar. All buses and transformers connected from the high side bus of each project to the corresponding generator were disabled.

GEN-2015-039 was disabled and a generator was placed at the study project's high side bus. The generator was modeled with PGEN = 50 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All

buses and transformers connected from the study project's high side bus to the generator was disabled.

GEN-2015-040 and the Mustang generation was disabled and a generator was placed at the study project's high side bus and the high side bus of the Mustang generation (GS-MUSTANG – Bus 527151). The GEN-2015-040 generator was modeled with PGEN = 50 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. The Mustang generator was modeled with PGEN = 496 MW, Qmin = -9999 Mvar, and Qmax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to GEN-2015-040 were disabled.

GEN-2015-041 (ELK_4), ELK_1, and GEN-2015-068 were disabled and a generator was placed at the GEN-2015-068 high side bus and two generators placed at the ELK generation high side bus (TUCO Bus 525832). The GEN-2015-068 generator was modeled with PGEN = 300.0 MW, Qmin = -9999 Mvar, Qmax = 9999 Mvar. The GEN-2015-041 generator was modeled with PGEN = 208.0 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. The remaining generator for ELK_1 was modeled with PGEN = 203.0 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to both projects were disabled.

GEN-2015-078 and Mustang generation was disabled and a generator was placed at the study project's high side bus and the Mustang generation high side bus (Mustang Bus 527146). The GEN-2015-078 generator was modeled with PGEN = 50.0 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. The Mustang generator was modeled with PGEN = 318 MW, Qmin = -9999 Mvar, and Qmax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to GEN-2015-078 were disabled.

ASGI-2016-001 and ASGI-2013-006 were disabled and two generators were placed at the study project's high side bus. The ASGI-2016-001 generator was modeled with PGEN = 2.5 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. The ASGI-2013-006 generator was modeled with PGEN = 2.0 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to the generator was disabled.

ASGI-2016-002 was disabled and a generator was placed at the study project's high side bus. The generator was modeled with PGEN = 2.53 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to the generator was disabled.

GEN-2016-002 was disabled and a generator was placed at the study project's high side bus. The generator was modeled with PGEN = 74 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to the generator was disabled.

ASGI-2016-004 was disabled and a generator was placed at the study project's high side bus. The generator was modeled with PGEN = 10 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to the generator was disabled.

GEN-2016-015 and GEN-2016-062 were disabled in the power flow case. A generator was placed at the high side bus of GEN-2016-015 and modeled with PGEN = 100 MW, Qmin = -9999 Mvar, and Qmax = 9999 Mvar. A second generator was placed at the high side bus of GEN-2016-062 and modeled with PGEN = 250.7 MW, Qmin = -9999 Mvar, and Qmax = 9999 Mvar All buses and transformers connected from the study project's high side bus to the generator was disabled. Separate power factor analysis was performed for both study generators.

GEN-2016-039 and GEN-2015-022 were disabled in the power flow case. A generator was placed at the high side bus of GEN-2016-039 and modeled with PGEN = 112 MW, Qmin = -9999 Mvar, Qmax = 9999 Mvar. A second generator was placed at the high side bus of GEN-2015-022 and modeled with PGEN = 112 MW, Qmin = -9999 Mvar, Qmax = 9999 Mvar. All buses and transformers connected from the high side bus of each project to the corresponding generator were disabled.

GEN-2016-056 was disabled and a generator was placed at the study project's high side bus. The generator was modeled with PGEN = 200 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to the generator was disabled.

GEN-2016-058 was disabled and a generator was placed at the study project's high side bus. The generator was modeled with PGEN = 200 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to the generator was disabled.

GEN-2016-069, GEN-2014-033, GEN-2014-035, and GEN-2014-034 were all disabled in the power flow case. A generator was placed at the high side bus of GEN-2016-069 and was modeled with PGEN = 31.35 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. A second generator was placed at the high side bus of GEN-2014-033 and modeled with PGEN = 70 MW, Qmin = -9999 Mvar, Qmax = 9999 Mvar. A third generator was placed at the high side bus of GEN-2014-035 and modeled with PGEN = 30 MW, Qmin = -9999 Mvar, Qmax = 9999 Mvar. A fourth generator was placed at the high side bus of GEN-2014-034 and modeled with PGEN = 70 MW, Qmin = -9999 Mvar, Qmax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to the generator was disabled.

5.2 Power Factor Analysis Results

The power factor was calculated for the 2016 Winter Peak, 2017 Summer Peak, 2020 Summer Peak, 2020 Winter Peak, and 2025 Summer Peak condition. The following tables show the power factor results for the study generators:

- Table 5-2: Power Factor Analysis for GEN-2015-018
- Table 5-3: Power Factor Analysis for GEN-2015-033
- Table 5-4: Power Factor Analysis for GEN-2015-039
- Table 5-5: Power Factor Analysis for GEN-2015-040
- Table 5-6: Power Factor Analysis for GEN-2015-041

- Table 5-7: Power Factor Analysis for GEN-2015-078
- Table 5-8: Power Factor Analysis for ASGI-2016-001
- Table 5-9: Power Factor Analysis for ASGI-2015-002
- Table 5-10: Power Factor Analysis for GEN-2016-002
- Table 5-11: Power Factor Analysis for ASGI-2016-004
- Table 5-12: Power Factor Analysis for GEN-2016-015
- Table 5-13: Power Factor Analysis for GEN-2016-039
- Table 5-14: Power Factor Analysis for GEN-2016-056
- Table 5-15: Power Factor Analysis for GEN-2016-058
- Table 5-16: Power Factor Analysis for GEN-2016-062
- Table 5-17: Power Factor Analysis for GEN-2016-069

Note that a positive Q (Mvar) output illustrates that the generator is absorbing reactive power from the system, implying a leading power factor; a negative Q (Mvar) illustrates that the generator is supplying reactive power to the system, implying a lagging power factor.

Study Generator GEN-2015-018

The Power Factor Analysis shows that GEN-2015-018 has a power factor range of 0.990 leading (absorbing) to 1.0 unity for the 2016 Winter Peak conditions, a power factor range of 0.973 leading (absorbing) to 0.973 lagging (supplying) for the 2017 Summer Peak conditions, a power factor range of 0.984 leading (absorbing) to 0.995 lagging (supplying) for the 2020 Summer Peak conditions, a power factor range of 0.989 leading (absorbing) to 1.0 unity for the 2020 Winter Peak conditions, and a power factor range of 0.968 leading (absorbing) to 0.992 lagging (supplying) for the 2025 Summer Peak conditions.

Table 5-3
Power Factor Analysis: GEN-2015-033

Cont. No.	Case	2016 Winter Peak			2017 Summer Peak			2020 Summer Peak			2020 Winter Peak			2025 Summer Peak

Study Generator GEN-2015-033

The Power Factor Analysis shows that GEN-2015-033 has a power factor range of 0.970 lagging to 0.999 lagging for the 2016 Winter Peak conditions, a power factor range of 0.999 leading to 0.995 lagging for the 2017 Summer Peak conditions, a power factor range of 0.998 leading to 0.993 lagging for the 2020 Summer Peak conditions, a power factor range of 0.990 leading to 0.998 lagging for the 2020 Winter Peak conditions, and a power factor range of 0.999 leading to 0.991 lagging for the 2025 Summer Peak conditions.

Study Generator GEN-2015-039

The Power Factor Analysis shows that GEN-2015-039 has a power factor range of 0.860 leading to 0.602 lagging for the 2016 Winter Peak conditions, a power factor range of 0.981 leading to 0.281 lagging for the 2017 Summer Peak conditions, a power factor range of 0.932 leading to 0.312 lagging for the 2020 Summer Peak conditions, a power factor range of 0.782 leading to 0.653 lagging for the 2020 Winter Peak conditions, and a power factor range of 0.981 leading to 0.435 lagging for the 2025 Summer Peak conditions.

Study Generator GEN-2015-040

The Power Factor Analysis shows that GEN-2015-040 has a power factor range of 0.997 leading to 0.372 lagging for the 2016 Winter Peak conditions, a power factor range of 0.940 leading to 0.560 lagging for the 2017 Summer Peak conditions, a power factor range of 0.641 lagging to 1.0 unity for the 2020 Summer Peak conditions, a power factor range of 0.996 leading to 0.334 lagging for the 2020 Winter Peak conditions, and a power factor range of 0.940 leading to 0.653 lagging for the 2025 Summer Peak conditions.

Table 5-6
Power Factor Analysis: GEN-2015-041

Cont. No.	Case	2016 Winter Peak			2017 Summer Peak			2020 Summer Peak			2020 Winter Peak			2025 Summer Peak

Study Generator GEN-2015-041

The Power Factor Analysis shows that GEN-2015-041 has a power factor range of 0.861 lagging to unity for the 2016 Winter Peak conditions, a power factor range of 0.985 leading to 0.970 lagging for the 2017 Summer Peak conditions, a power factor range of 0.996 leading to 0.963 lagging for the 2020 Summer Peak conditions, a power factor range of 0.998 leading to 0.903 lagging for the 2020 Winter Peak conditions, and a power factor range of 0.987 leading to 0.980 lagging for the 2025 Summer Peak conditions.

Study Generator GEN-2015-078

The Power Factor Analysis shows that GEN-2015-078 has a power factor range of 0.729 to 0.956 lagging for the 2016 Winter Peak conditions, a power factor range of 0.664 to 0.942 lagging for the 2017 Summer Peak conditions, a power factor range of 0.669 to 0.885 lagging for the 2020 Summer Peak conditions, a power factor range of 0.721 to 0.956 lagging for the 2020 Winter Peak conditions, and a power factor range of 0.584 to 0.584 lagging for the 2025 Summer Peak conditions.

Study Generator ASGI-2016-001

The Power Factor Analysis shows that ASGI-2016-001 has a power factor range of 0.485 leading to 0.154 lagging for the 2016 Winter Peak conditions, a power factor range of 0.248 leading to 0.147 lagging for the 2017 Summer Peak conditions, a power factor range of 0.251 lagging to 0.140 lagging for the 2020 Summer Peak conditions, a power factor range of 0.552 leading to 0.186 lagging for the 2020 Winter Peak conditions, and a power factor range of 0.315 leading to 0.117 lagging for the 2025 Summer Peak conditions.

Study Generator ASGI-2016-002

The Power Factor Analysis shows that ASGI-2016-002 has a power factor range of 0.932 leading to 0.691 lagging for the 2016 Winter Peak conditions, a power factor range of 0.732 leading to 0.653 lagging for the 2017 Summer Peak conditions, a power factor range of 0.720 lagging to 0.636 lagging for the 2020 Summer Peak conditions, a power factor range of 0.939 leading to 0.793 lagging for the 2020 Winter Peak conditions, and a power factor range of 0.806 leading to 0.565 lagging for the 2025 Summer Peak conditions.

Table 5-10
Power Factor Analysis: GEN-2016-002

Study Generator GEN-2016-002

The Power Factor Analysis shows that GEN-2016-002 has a power factor range of 0.981 leading to 0.999 lagging for the 2016 Winter Peak conditions, a power factor range of 0.982 leading to 0.964 lagging for the 2017 Summer Peak conditions, a power factor range of 0.990 lagging to 0.972 lagging for the 2020 Summer Peak conditions, a power factor range of 0.980 leading to 1.0 unity for the 2020 Winter Peak conditions, and a power factor range of 0.971 leading to 0.934 lagging for the 2025 Summer Peak conditions.

Study Generator ASGI-2016-004

The Power Factor Analysis shows that ASGI-2016-004 has a power factor range of 0.756 leading to 0.514 lagging for the 2016 Winter Peak conditions, a power factor range of 0.793 leading to 0.518 lagging for the 2017 Summer Peak conditions, a power factor range of 0.701 lagging to 0.458 lagging for the 2020 Summer Peak conditions, a power factor range of 0.748 leading to 0.490 lagging for the 2020 Winter Peak conditions, and a power factor range of 0.666 leading to 0.492 lagging for the 2025 Summer Peak conditions.

Study Generator GEN-2016-015

The Power Factor Analysis shows that GEN-2016-015 has a power factor range of 0.994 leading to 0.999 lagging for the 2016 Winter Peak conditions, a power factor range of 0.970 leading to 0.982 lagging for the 2017 Summer Peak conditions, a power factor range of 0.987 lagging to 0.998 lagging for the 2020 Summer Peak conditions, a power factor range of 0.984 leading to 0.999 lagging for the 2020 Winter Peak conditions, and a power factor range of 0.958 leading to 0.998 lagging for the 2025 Summer Peak conditions.

Study Generator GEN-2016-039

The Power Factor Analysis shows that GEN-2016-039 has a power factor range of 0.987 leading to 0.999 lagging for the 2016 Winter Peak conditions, a power factor range of 0.977 leading to 0.993 lagging for the 2017 Summer Peak conditions, a power factor range of 0.978 lagging to 0.995 lagging for the 2020 Summer Peak conditions, a power factor range of 0.985 leading to 1.0 unity for the 2020 Winter Peak conditions, and a power factor range of 0.971 leading to 0.983 lagging for the 2025 Summer Peak conditions.

Study Generator GEN-2016-056

The Power Factor Analysis shows that GEN-2016-056 has a power factor range of 0.979 leading to 0.994 lagging for the 2016 Winter Peak conditions, a power factor range of 0.998 leading to 0.871 lagging for the 2017 Summer Peak conditions, a power factor range of 0.945 lagging to 0.781 lagging for the 2020 Summer Peak conditions, a power factor range of 0.999 leading to 0.949 lagging for the 2020 Winter Peak conditions, and a power factor range of 0.869 lagging to 1.0 unity for the 2025 Summer Peak conditions.

Study Generator GEN-2016-058

The Power Factor Analysis shows that GEN-2016-058 has a power factor range of 0.855 leading to 0.985 lagging for the 2016 Winter Peak conditions, a power factor range of 0.996 leading to 0.761 lagging for the 2017 Summer Peak conditions, a power factor range of 0.872 lagging to 0.899 lagging for the 2020 Summer Peak conditions, a power factor range of 0.854 leading to 0.969 lagging for the 2020 Winter Peak conditions, and a power factor range of 0.782 leading to 0.946 lagging for the 2025 Summer Peak conditions.

Study Generator GEN-2016-062

The Power Factor Analysis shows that GEN-2016-062 has a power factor range of 0.999 leading to 0.999 lagging for the 2016 Winter Peak conditions, a power factor range of 0.995 leading to 0.997 lagging for the 2017 Summer Peak conditions, a power factor range of 0.997 lagging to 0.999 lagging for the 2020 Summer Peak conditions, a power factor range of 0.997 leading to 0.999 lagging for the 2020 Winter Peak conditions, and a power factor range of 0.993 leading to 0.999 lagging for the 2025 Summer Peak conditions.

Table 5-17
Power Factor Analysis: GEN-2016-069

Cont. No.	Case	2016 Winter Peak			2017 Summer Peak			2020 Summer Peak			2020 Winter Peak			2025 Summer Peak

Study Generator GEN-2016-069

The Power Factor Analysis shows that GEN-2016-069 has a power factor range of 0.937 to 0.975 leading for the 2016 Winter Peak conditions, a power factor range of 0.915 to 0.973 leading for the 2017 Summer Peak conditions, a power factor range of 0.967 to 0.987 leading for the 2020 Summer Peak conditions, a power factor range of 0.962 to 0.986 leading for the 2020 Winter Peak conditions, and a power factor range of 0.951 to 0.973 leading for the 2025 Summer Peak conditions.

SECTION 6: LOW WIND/IRRADIANCE ANALYSIS

The objective of this task was to determine the impact of low wind/solar irradiance or no wind/solar irradiance conditions on wind farms and solar farms, respectively. The 2016 Winter Peak, 2017 Summer Peak, 2020 Summer Peak, 2020 Winter Peak, and 2025 Summer Peak power flows provided by SPP were examined for this analysis.

6.1 Approach

Low/no wind and low/no solar irradiance conditions were examined for all renewable interconnections. Generators were disabled (independently), but the collector systems remained in-service. In order to maintain generation and load balance in the SPP area, the generation was scaled after disabling the respective generator. The amount of reactive power injected into the transmission network was recorded at the respective point of interconnection. This reactive power comes from the capacitance of the project's transmission lines and collector cables. A shunt reactor was added at the high side bus to bring the Mvar flow into the POI down to approximately zero.

6.2 Low Wind/Irradiance Analysis Results

The reactance needed to bring the Mvar flow into the point of interconnect to zero Mvar was recorded for each season for renewable interconnections. Refer to Table 6-1 for the results of this analysis. The table lists the generators examined and the amount of reactive power needed for zero Mvar flow into the POI for each season.

Table 6-1
Low Wind/Irradiance Analysis

SECTION 7: CONCLUSIONS

Summary of Stability Analysis

The Stability Analysis determined that there were multiple contingencies across all seasons that resulted in system/voltage instability, generation tripping offline, and poor post-fault voltage recovery when all generation interconnection requests were at 100% output.

To mitigate the system/voltage instability, voltage violations, generation tripping offline, and poor post-fault steady-state voltages, the following upgrades were provided by SPP and implemented (upgrades provided here are required for 16WP season and thus, implemented in remaining years):

- Crawfish Draw to Seminole 765 kV circuit #1
- Crawfish Draw 765/345 kV transformer 1 & 2
- Seminole 765/345 kV transformer 1 & 2
- Potter County to Grapevine to Chisholm 345 kV circuit #1
- Potter County to Tolk 345 kV circuit #1
- Tolk to Crawfish Draw 345 kV circuit #1
- OKU SVC +300/-100 Mvar (add +200 Mvar)
- Add 200 Mvar Capacitor Bank at OKU 345 kV (550 Mvar capacitor bank total)
- Chaves County – Price – CV Pine – Capitan 115 kV circuit #1
    - Required to be implemented in 16WP and 17SP
    - Line exists in 20WP, 20SP, and 25SP
- Grapevine to Beaver County 345 kV circuit #1
- Beaver County to Clark County 345 kV circuit #1
- Re-terminate the Yoakum to TUCO 345 kV line from TUCO to Crawfish Draw
- TUCO to Crawfish Draw 345 kV circuit #2
- Rio Blanco +300/-100 Mvar SVC

In the 16WP and 20WP seasons, under normal system dispatch, system instability exists for a fault at Crawfish Draw 765 kV that results in the loss of the Crawfish Draw to Seminole 765 kV line. For this reason, it is necessary to limit the flow along the Crawfish Draw to Seminole 765 kV line. The following flow limits are required for the 16WP and 20WP seasons, respectively:

- 16WP Flow Limit on Crawfish Draw to Seminole 765 kV: 1625 MW from Crawfish Draw 765 kV end
- 20WP Flow Limit on Crawfish Draw to Seminole 765 kV: 1395 MW from Crawfish Draw 765 kV end

Several violations exist only in the 20SP, 20WP, and 25SP seasons. Refer below for the additional mitigation required for these seasons (seasons listed in parenthesis for which mitigation is required):

- NA Enrich 115 kV capacitor bank: 28.8 Mvar (20WP, 20SP) (an existing cap bank)
- Drinkard 115 kV capacitor bank: 14.4 Mvar (20WP) (an existing cap bank)
- Additional Andrews to NA Enrich 115 kV circuit #2
- Seminole to Mustang 115 kV circuit #1 (25SP)
- Hereford 115 kV capacitor bank: 25 Mvar (25SP) (a new cap bank)

Note for GEN-2016-015, for a three-phase fault at the point of interconnection (Andrews 230 kV), the TMEIC photovoltaic inverter model (ITMEIC) tripped offline due to over frequency protection and over voltage protection. For this study, the over frequency and over voltage protection were set to 75 Hz and 1.8 p.u., respectively, to avoid instantaneous tripping. It is recommended the supplier of the TMEIC photovoltaic inverter model examine this model for three-phase faults that cause the model to trip on over frequency and over voltage protection.

For GEN-2016-002, the Gamesa User Model (GD0800_V32.lib) exhibited errors in the stability analysis. It was observed that other interconnection projects utilized the Gamesa GXX048 module (GXX048_v32.lib) which exhibited expected response to system disturbances. Therefore, the GXX048 module was used to replace the supplied GD0800 module.

After implementing the above upgrades, the contingency analysis was re-simulated for all contingencies. With the upgrades, the Stability Analysis determined that there was no wind turbine tripping or system instability observed as a result of interconnecting all study projects at 100% output.

Summary of the Short Circuit Analysis

The short circuit analysis was performed on the 2017 Summer Peak and 2025 Summer Peak power flows for all study projects. Refer to Table 7-1 and Table 7-2 for a list of maximum fault currents observed for each study project for the 17SP and 25SP cases, respectively.

Table 7-1

GEN-2016-069	6.36	30.33	Cunningham	115 kV

Summary of Power Factor Analysis

The upgrades identified in the Stability Analysis were implemented in the power flow cases and utilized for the Power Factor Analysis. Refer to Table 7-3 for the power factor analysis results for each study generator.

Table 7-3
Power Factor Analysis Summary for Study Projects

Study Project	Power Factor Range for Each Study Project[1]

Summary of Low Wind/Irradiance Analysis

The amount of reactive power injected into the transmission network was recorded at the point of interconnection for each wind and solar powered interconnection request for each season. The maximum reactance needed for zero Mvar flow was 12.7 Mvar for GEN-2016-062 (Andrews 230 kV). The minimum reactance needed for zero Mvar flow was 0.0 Mvar for ASGI-2016-001 (Wolfforth 115 kV) and ASGI-2016-004 (Palo Duro 115 kV).

1/31/2017	SPP	DISIS-2016-001 Group 7 Stability Report Issued

Executive Summary

DISIS-2016-001 Group 7 Interconnection Customers have requested a Definitive Interconnection System Impact Study detailing the impacts of interconnecting the generation projects shown below.

- GEN-2016-008 – 40.0 MW photovoltaic solar generation facility using eighty (80) Advanced Energy 500NX 0.5 MW inverters interconnecting to the Western Farmers Electric Cooperative (WFEC) transmission system at the existing Granite 69 kV station.
- GEN-2016-037 – 300.0 MW wind generation facility using one-hundred fifty (150) Vestas V110 2.0 MW wind turbine generators interconnecting to the American Electric Power (AEPW) transmission system at a tap on the proposed Gracemont to Chisholm 345 kV line.
- GEN-2016-051 – 9.8 MW uprate, 0.1 MW per turbine, to the existing 147.0 MW Weatherford wind generation facility currently comprised of ninety-eight (98) GE 1.5 MW wind turbine generators interconnected to the American Electric Power (AEPW) transmission system at the existing Weatherford Windfarm Tap 138 kV station. GEN-2016-051 request is to uprate each of the ninety-eight (98) GE 1.5 MW wind turbine generators to 1.6 MW rating for a total nameplate capacity of 156.8 MW.

A stability cluster impact analysis was performed for the generation project from the DISIS-2016-001 Group 7 study. The analysis was performed on three (3) seasonal models including 2016 winter peak (16WP), the 2017 summer peak (17SP), and the 2025 summer peak (25SP) cases. These cases are modified versions of the 2015 model series of Model Development Working Group (MDWG) dynamic study models. A total of one-hundred sixteen (116) contingencies were evaluated for the three (3) seasonal cases.

Stability analysis has determined with all previously assigned Network Upgrades in service, rerouting the Woodward to Border 345 kV line to tie into the proposed Chisholm 345 kV substation, GEN-2016-008 installing the extended frequency protection option, and resetting the protective relays on the Wheeler to Sweetwater 230kV line, all generators in the monitored areas remained stable and within the pre-contingency, voltage recovery, and post fault voltage recovery criterion of 0.7pu to 1.2pu for the entire modeled disturbances. Under certain system conditions the interconnection requests may be required to curtail generation output to maintain system reliability.

In addition to the cluster impact stability analysis, a stand-alone stability analysis was conducted for each request. This analysis demonstrated that GEN-2016-008 must install the extended frequency protection option, GEN-2016-037 requires rerouting the Woodward to Border 345 kV line to tie into the proposed Chisholm 345 kV substation and the protective relays on the Wheeler to Sweetwater 230kV line to be reset.

Power factor analysis for each generation project was performed on the current study 2016 winter peak, 2017 summer peak, and 2025 summer peak cases with identified system upgrades. As reactive power is required for all projects, the final requirement in the GIA will be the pro-forma 95% lagging to 95% leading at the point of interconnection.

A reduced generation analysis was conducted for wind farms to determine reactor inductive amounts to compensate the capacitive effects on the transmission system during low or reduced wind conditions cause by the interconnecting project's generator lead transmission line and collector systems. Each request may be required to install the following reactors on their facilities: GEN-2016-008 – 0.5 Mvar, GEN-2016-037 – 29.8 Mvar, and GEN-2016-051 – 0.5 Mvar.

Short Circuit analysis was conducted using the current study upgrade 2025 summer peak case.

Nothing in this study should be construed as a guarantee of delivery or transmission service. If the customer wishes to sell power from the facility, a separate request for transmission service must be requested on Southwest Power Pool's OASIS by the Customer.

1. Introduction

DISIS-2016-001 Group 7 Interconnection Customers have requested a Definitive Interconnection System Impact Study detailing the impacts of interconnecting the generation projects shown **Table 1-1** below.

Table 1-1: Group 7 Interconnection Requests

Request	Capacity (MW)	Generator Model	Point of Interconnection
GEN-2016-008	40.0	Advanced Energy 500NX 0.5 MW solar inverters (587063)	Granite 69kV (520927)
GEN-2016-037	300.0	Vestas V110 2.0 MW (587233)	Tap Chisholm (511553) – Gracemont (515800) 345kV, (G16-037-TAP, 560078)
GEN-2016-051	9.8 (uprate of GEN-2003-022 & GEN-2004-020; Total power = 156.8 MW)	GE 1.6 MW (579363)	Tap Clinton Junction (511534) – Weatherford Southeast (511536) 138kV, (Weatherford Windfarm Tap 138kV, 511506)

The previously queued generation projects in the Group 7 area are listed in **Table 1-2** below.

Table 1-2: Group 7 Prior Queued Interconnection Requests

Request	Capacity (MW)	Generator Model	Point of Interconnection
Blue Canyon I (GEN-2001-026)	74.3	NEG Micon (Vestas) NM72 (WT1G1) (599006)	Washita 138kV (521089)
Red Hills Wind (GEN-2002-005)	120.0	Acciona 1.5 MW (599018)	Moorewood – Elk City 138kV (521116)
Blue Canyon II (GEN-2003-004, GEN-2004-023, & GEN-2005-003)	151.2	Vestas V80 1.8 MW (599003)	Washita 138kV (521089)
Blue Canyon V (GEN-2003-005 & GEN-2011-037)	105.6	GE 1.6 MW (599023)	Blue Canyon V Tap on the Anadarko – Paradise 138kV line (521129)
Weatherford (GEN-2003-022 & GEN-2004-020)	147.0	GE 1.5 MW (579363)	Weatherford Windfarm Tap 138kV (511506)
Elk City II (GEN-2006-002)	100.8	GE 1.5 MW (599036) & GE 1.6 MW (599038)	Sweetwater 230kV (511541)
Dempsey (GEN-2006-035)	224.0	Gamesa G87 or G90 2.0 MW (599049 & 599050)	Sweetwater 230kV (511541)
Elk City (GEN-2006-043)	98.9	Siemens 2.3 MW (599051)	Sweetwater 230kV (511541)
GEN-2007-052	150	Gas Turbine (521110, 521111, & 521112)	Anadarko 138kV (520814)
Rocky Ridge (GEN-2008-023)	148.8	GE 1.6 MW (599092 & 599094)	Hobart Junction 138kV (511463)
Blue Canyon VI (GEN-2008-037)	99.0	Vestas V90 VCUS 1.8 MW (599098)	Washita 138kV (521089)
GEN-2011-049	250.7	Siemens 2.3 MW (583093 & 583096)	Border 345kV (515458)

Table 1-2: Group 7 Prior Queued Interconnection Requests

Request	Capacity (MW)	Generator Model	Point of Interconnection
GEN-2012-028	74.8	Vestas V110 VCSS 2.0 MW (583403)	Gotebo 69kV (520925)
GEN-2015-004	52.9 (uprate of GEN-2011-049; Total power = 303.6 MW)	Siemens 2.3 MW (583093 & 583096)	Border 345kV (515458)
GEN-2015-013	120.0	Eaton Power Xpert Solar Inverters 1.67 MW (584553)	Snyder 138kV (521052)
GEN-2015-055	40.0	Advanced Energy AE 500NX 0.5 MW solar inverters (584933)	Erick 138kV (520903)
GEN-2015-071	200.0	Vestas V110 2.0 MW (585083)	Chisholm (511553) 345kV
GEN-2015-084	51.3	GE 1.9 MW solar inverter (585213)	Hollis (511507) 138kV
GEN-2015-085	122.4	GE 3.6 MW solar inverter (585223)	Altus (511440) 138kV

A stability analysis was performed for the addition of the generation projects in Group 7. The analysis was performed on three (3) seasonal models including 2016 winter peak (16WP), the 2017 summer peak (17SP), and the 2025 summer peak (25SP) cases. These cases are modified versions of the 2015 model series of Model Development Working Group (MDWG) dynamic study models.

The stability analysis determines the impacts of the new interconnecting project on the stability and voltage recovery of the nearby systems and the ability of the interconnecting project to meet FERC Order 661A. If problems with stability or voltage recovery are identified, the need for reactive compensation or system upgrades is investigated. The contingencies listed in **Table 3-1** were used in the stability analysis.

The power factor analysis determines the power factor at the point of interconnection (POI) for the wind interconnection projects for pre-contingency and post-contingency conditions. The contingencies used in the power factor analysis are a subset of the stability analysis contingencies shown in **Table 3-1**.

A reduced generation analysis was conducted for wind farms to determine reactor inductive amounts to compensate the capacitive effects on the transmission system during low or reduced wind conditions cause by the interconnecting project's generator lead transmission line and collector systems. **Table 5-1** displays the minimum reactor inductive amount requirement to compensate capacitive effects from the GEN-2016-008, GEN-2016-037, & GEN-2016-051 facilities.

Short Circuit analysis was conducted using the current study upgrade 2025 summer peak case. The results from the Short circuit analysis are show in Appendix F.

Nothing in this System Impact Study constitutes a request for transmission service or grants the Interconnection Customer any rights to transmission service. If the customer wishes to sell power from

the facility, a separate request for transmission service must be requested on Southwest Power Pool's OASIS by the Customer.

2. Facilities

A one-line PSS/E slider drawings from the 16WP case for each of the generation interconnection requests in this study is shown in **Figure 2-1**, **Figure 2-2**, & **Figure 2-3**.

Figure 2-1*:* GEN-2016-008 One-line Diagram

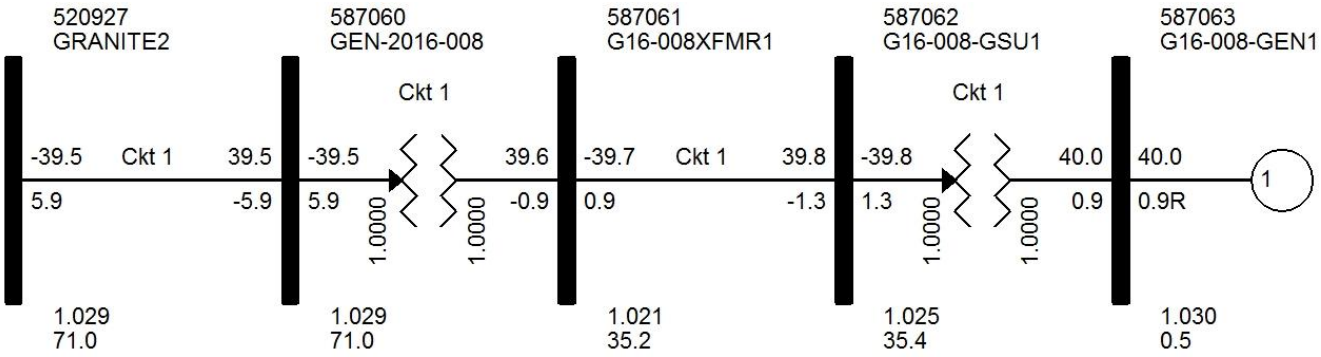

Figure 2-2*:* GEN-2016-037 One-line Diagram

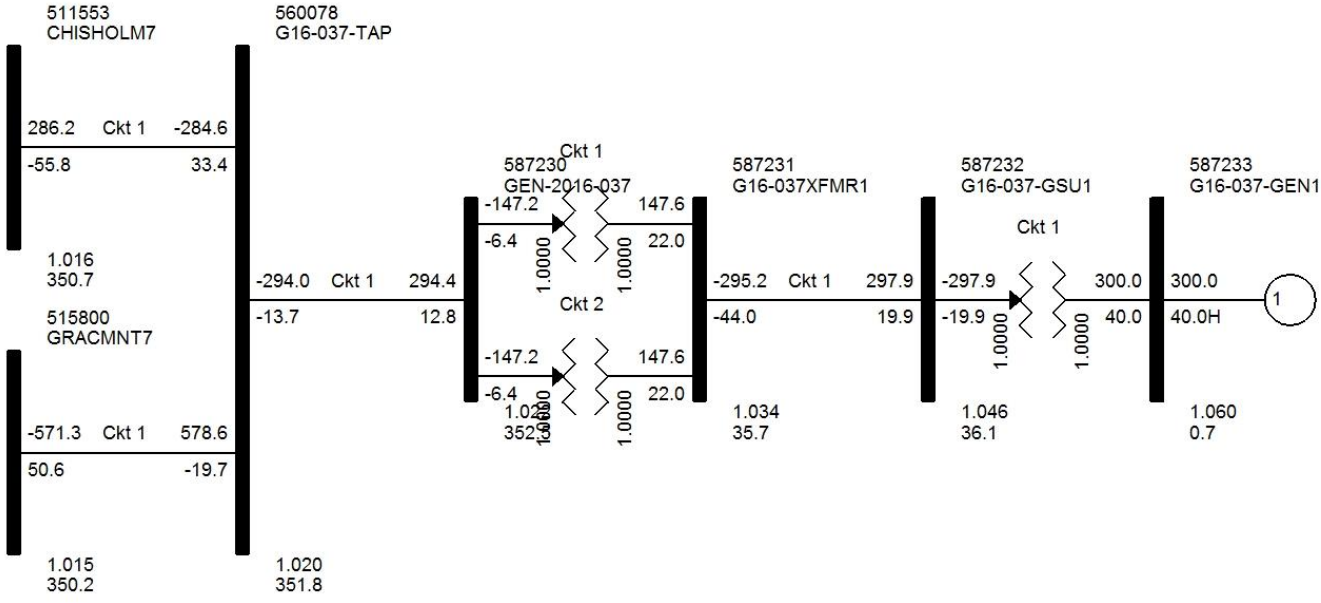

Figure 2-3: GEN-2016-051 One-line Diagram

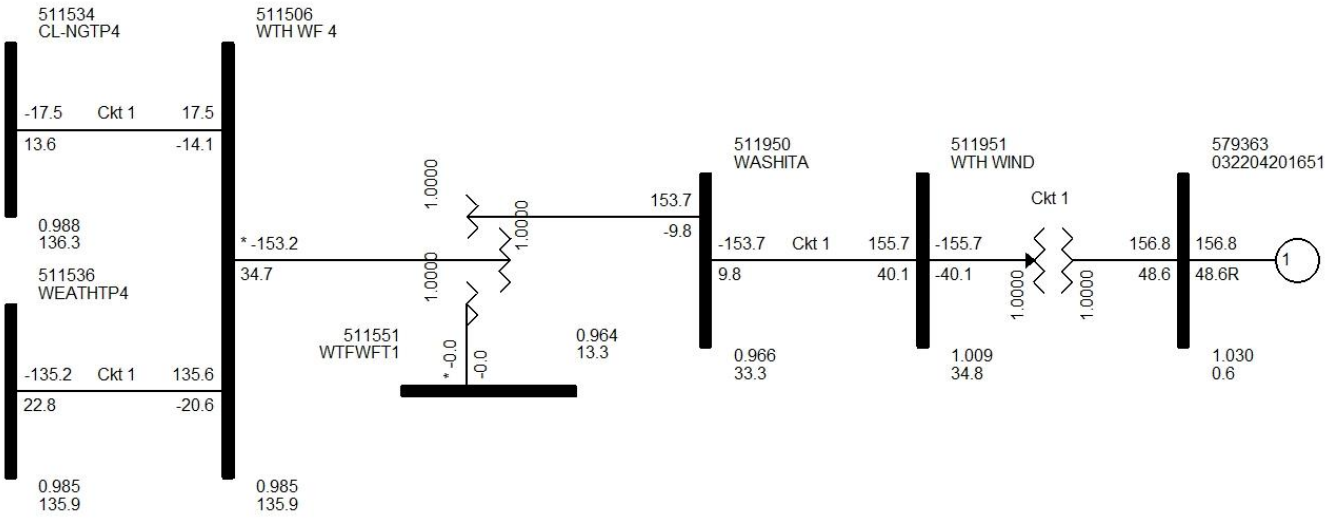

3. Stability Analysis

Transient stability analysis is used to determine if the transmission system can maintain angular stability and ensure bus voltages stay within planning criteria bandwidth during and after a disturbance while considering the addition of a generator interconnection request.

Model Preparation

Transient stability analysis was performed using modified versions of the 2015 series of Model Development Working Group (MDWG) dynamic study models including the 2016 winter peak, 2017 summer peak, and the 2025 summer peak seasonal models. The cases are then loaded with prior queued interconnection requests and network upgrades assigned to those interconnection requests. Finally the prior queued and study generation are dispatched into the SPP footprint. Initial simulations are then carried out for a no-disturbance run of twenty (20) seconds to verify the numerical stability of the model.

Disturbances

One-hundred sixteen (116) contingencies were identified for use in this study and are listed in **Table 3-1**. These contingencies are faults at locations defined by SPP Generation Interconnection Staff. These contingencies include three-phase N-1, single-phase stuck breaker, and three-phase prior outage faults. Single-phase line faults were simulated by applying fault impedance to the positive sequence network at the fault location to represent the effect of the negative and zero sequence networks on the positive sequence network. The fault impedance was computed to give a positive sequence voltage at the specified fault location of approximately 60% of pre-fault voltage. This method is in agreement with SPP current practice.

Except for transformer faults, the typical sequence of events for a three-phase fault is as follows:

1. apply fault at particular location
2. continue fault for five (5) cycles, clear the fault by tripping the faulted facility
3. after an additional twenty (20) cycles, re-close the previous facility back into the fault
4. continue fault for five (5) additional cycles
5. trip the faulted facility and remove the fault

Transformer faults are typically modeled as three-phase faults, unless otherwise noted. The sequence of events for a transformer fault is as follows:

1. apply fault for five (5) cycles
2. clear the fault by tripping the affected transformer facility (unless otherwise noted there will be no re-closing into a transformer fault)

The SPP areas monitored during the stability analysis were:

- 520: American Electric Power (AEPW)
- 524: Oklahoma Gas and Electric Company (OKGE)
- 525: Western Farmers Electric Cooperative (WFEC)
- 526: Southwestern Public Service (SPS)
- 531: Midwest Energy, Inc. (MIDW)
- 534: Sunflower Electric Power Corp. (SUNC)
- 536: Westar Energy, Inc. (WERE)

Table 3-1: Contingencies Evaluated

Cont. No.	Contingency Name	Description
0	FLT_000_NOFAULT	No Fault Conditions
1	FLT_001_GRANITE2_LKCREEK2_69kV	3 phase fault on the Granite (520927) to LK Creek (520978) 69 kV line, near Granite. a. Apply fault at the Granite 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
2	FLT_002_GRANITE2_OMMANGM2_69kV	3 phase fault on the Granite (520927) to OMMANGM2 (529342) 69 kV line, near Granite. a. Apply fault at the Granite 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
3	FLT_003_LKCREEK2_LONEWLF2_69kV	3 phase fault on the LK Creek (520978) to Lone WLF (520982) 69kV line, near LK Creek. a. Apply fault at the LK Creek 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
4	FLT_004_LKCREEK2_CARTERJ2_69kV	3 phase fault on the LK Creek (520978) to Carter J (520846) 69 kV line, near Lk Creek. a. Apply fault at the Lk Creek 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
5	FLT_005_OMMANGM2_RUSSELL2_69kV	3 phase fault on the OMMANGM2 (529342) to Russell (521042) 69 kV line, near OMMANGM2. a. Apply fault at the OMMANGM2 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
6	FLT_006_RUSSELL2_RUSSELL4_69_138kV	3 phase fault on the Russell 69 kV (521042) to Russell 138kV (521043) to Russell 13.8kV (521175) transformer, near Russell 69 kV. a. Apply fault at the Russell 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted transformer.
7	FLT_007_RUSSELL2_ALTUS2_69kV	3 phase fault on the Russell (521042) to Altus (520803) 69 kV line, near Russell. a. Apply fault at the Russell 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
8	FLT_008_RUSSELL2_GYPSUM2_69kV	3 phase fault on the Russell (521042) to Gypsum (520929) 69 kV line, near Russell. a. Apply fault at the Russell 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
9	FLT_009_RUSSELL2_VERNON2_69kV	3 phase fault on the Russell (521042) to Vernon (521081) 69 kV line, near Russell. a. Apply fault at the Russell 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
10	FLT_010_RUSSELL4_ALTUSJT4_138kV	3 phase fault on the Russell (521043) to Altus (511440) 138 kV line, near Russell. a. Apply fault at the Russell 138 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
11	FLT_011_RUSSELL4_LAKEP4WT_138kV	3 phase fault on the Russell (521043) to LAKEP4WT (512110) 138 kV line, near Russell. a. Apply fault at the Russell 138 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
12	FLT_012_LAKEP4WT_LAKEP2WT_138_69kV	3 phase fault on the LAKEP4WT 138kV (512110) to LAKEP2WT 69kV (512111) to LP2TERT 14.4kV (512112) transformer, near LAKEP4WT 138kV. a. Apply fault at the LAKEP4WT 138kV bus. b. Clear fault after 5 cycles by tripping the faulted transformer.
13	FLT_013_LAKEP4WT_CHILD4WT_138kV	3 phase fault on the LAKEP4WT (512110) to CHILD4WT (512101) 138 kV line, near LAKEP4WT. a. Apply fault at the LAKEP4WT 138 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Table 3-1: Contingencies Evaluated

Cont. No.	Contingency Name	Description
14	FLT_014_CHILD4WT_HOLTP4WT_138kV	3 phase fault on the CHILD4WT (512101) to HOLTP4WT (512103) 138 kV line, near CHILD4WT. a. Apply fault at the CHILD4WT 138 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
15	FLT_015_ALTUSJT4_OMPARK4_138kV	3 phase fault on the Altus (511440) to Ompark (529345) 138 kV line, near Altus. a. Apply fault at the Altus 138 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
16	FLT_016_ALTUSJT4_SNYDER4_138kV	3 phase fault on the Altus (511440) to Snyder (511435) 138 kV line, near Altus. a. Apply fault at the Altus 138 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
17	FLT_017_SNYDER4_SNYDER2_138_69kV	3 phase fault on the Snyder 138kV (521052) to Snyder 69kV (521051) to Snyder 14.4kV (521176) transformer, near Snyder 138kV. a. Apply fault at the Snyder 138kV bus. b. Clear fault after 5 cycles by tripping the faulted transformer.
18	FLT_018_SNYDER4_CACHE4_138kV	3 phase fault on the Snyder (511435) to Cache (511500) 138 kV line, near Snyder. a. Apply fault at the Snyder 138 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
19	FLT_019_OMPVET4_OMALTUS4_138kV	3 phase fault on the Ompvet (529298) to Omaltus (529302) 138 kV line, near Ompvet. a. Apply fault at the Ompvet 138 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
20	FLT_020_GOTEBO2_CORDELL2_69kV	3 phase fault on the Gotebo (520925) to CORDELL (520866) 69 kV line, near Gotebo. a. Apply fault at the Gotebo 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
21	FLT_021_GOTEBO2_MTNVIEW2_69kV	3 phase fault on the Gotebo (520925) to MTNVIEW (521003) 69 kV line, near Gotebo. a. Apply fault at the Gotebo 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
22	FLT_022_INDPARK2_ARAPAHO2_69kV	3 phase fault on the INDPARK (520955) to ARAPAHO (520815) 69 kV line, near INDPARK. a. Apply fault at the INDPARK 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
23	FLT_023_WASHITA4_WASHITA2_138_69kV	3 phase fault on the Washita 69kV (521088) to Washita 138kV (521089) to Washita 13.8kV (521179), near Washita 138kV. a. Apply fault at the Washita 138kV bus. b. Clear fault after 5 cycles by tripping the faulted transformer.
24	FLT_024_WASHITA2_CADDO2_69kV	3 phase fault on the Washita (521088) to Caddo (520838) 69 kV line, near Washita. a. Apply fault at the Washita 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
25	FLT_025_ELKCTY4_ELKCTY2_138_69kV	3 phase fault on the Elk City 69kV (511459) to Elk City 138kV (511458) to Elk City 13.8kV (511493), near Elk City 138kV. a. Apply fault at the Elk City 138kV bus. b. Clear fault after 5 cycles by tripping the faulted transformer.
26	FLT_026_ELKCTY4_ELKCITY6_138_230kV	3 phase fault on the Elk City 138kV (511458) to Elk City 230kV (511490) to Elk City 13.8kV (511482), near Elk City 138kV. a. Apply fault at the Elk City 138kV bus. b. Clear fault after 5 cycles by tripping the faulted transformer.

Table 3-1: Contingencies Evaluated

Cont. No.	Contingency Name	Description
27	FLT_027_ELKCTY4_FALCNRD4_138kV	3 phase fault on the Elk City (511458) to FALCNRD (511511) 138kV line, near Elk City. a. Apply fault at the Elk City 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
28	FLT_028_ELKCTY4_CLAFTP4_138kV	3 phase fault on the Elk City (511458) to CL-AFTP (511446) 138kV line, near Elk City. a. Apply fault at the Elk City 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
29	FLT_029_ELKCTY4_RHWIND4_138kV	3 phase fault on the Elk City (511458) to RHWIND/ GEN-2002-005 (521116) 138kV line, near Elk City. a. Apply fault at the Elk City 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
30	FLT_030_G16037TAP_CHISHOLM7_345kV	3 phase fault on the G16-037-Tap (560078) to Chisholm (511553) 345 kV line, near G16-037-Tap. a. Apply fault at the G16-037-Tap 345 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
31	FLT_031_G16037TAP_GRACMNT7_345kV	3 phase fault on the G16-037-Tap (560078) to Gracemont (515800) 345 kV line, near G16-037-Tap. a. Apply fault at the G16-037-Tap 345 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
32	FLT_032_CHISHOLM7_CHISHOLM6_345_230kV	3 phase fault on the Chisholm (511553) 345kV to Chisholm (511557) 230kV to Chisholm (511558) 13.8kV transformer, near Chisholm 345kV. a. Apply fault at the Chisholm 345kV bus. b. Clear fault after 5 cycles by tripping the faulted transformer.
33	FLT_033_CHISHOLM6_ELKCITY6_230kV	3 phase fault on the Chisholm (511557) to Elk City (511490) 230kV line, near Chisholm. a. Apply fault at the Chisholm 230kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
34	FLT_034_CHISHOLM6_SWEETWT6_230kV	3 phase fault on the Chisholm (511557) to Sweetwater (511541) 230kV line, near Chisholm. a. Apply fault at the Chisholm 230kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
35	FLT_035_SWEETWT6_STLNDEMARC6_230kV	3 phase fault on the Sweetwater (511541) to STLN-DEMARC (523779) 230kV line, near Sweetwater. a. Apply fault at the Sweetwater 230kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
36	FLT_036_WHEELER6_GRAPEVINE6_230kV	3 phase fault on the Wheeler (523777) to Grapevine (523771) 230kV line, near Wheeler. a. Apply fault at the Wheeler 230kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
37	FLT_037_GRACMNT7_MINCO7_345kV	3 phase fault on the Gracemont (515800) to Minco 345kV line, near Gracemont. a. Apply fault at the Gracemont 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
38	FLT_038_GRACMNT7_GRACMNT4_345_138kV	3 phase fault on the Gracemont (515800) 345kV to Gracemont (515802) 138kV to Gracemont (515801) 13.8kV transformer, near Gracemont. a. Apply fault at the Gracemont 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line.
39	FLT_039_GRACMNT4_ANADARK4_138kV	3 phase fault on the Gracemont (515800) to Anadarko (520814) 138kV line, near Gracemont. a. Apply fault at the Gracemont 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Table 3-1: Contingencies Evaluated

Cont. No.	Contingency Name	Description
40	FLT_040_GRACMNT4_WASHITA4_138kV	3 phase fault on the Gracemont (515800) to Washita (521089) 138kV CKT 1, near Gracemont. a. Apply fault at the Gracemont 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
41	FLT_041_DBLGRACMNT4_WASHITA4_138kV	3 phase fault on the Gracemont (515800) to Washita (521089) 138kV CKT 1 & 2, near Gracemont. a. Apply fault at the Gracemont 138kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).
42	FLT_042_ANADARK4_BLUCAN54_138kV	3 phase fault on the Anadarko (520814) to Blucan (521129) 138kV line, near Anadarko. a. Apply fault at the Anadarko 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
43	FLT_043_ANADARK4_POCASET4_138kV	3 phase fault on the Anadarko (520814) to Pocaset (521031) 138kV line, near Anadarko. a. Apply fault at the Anadarko 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
44	FLT_044_ANADARK4_SEQUOYAHJ4_138kV	3 phase fault on the Anadarko (520814) to SEQUOYAHJ (520422) 138kV line, near Anadarko. a. Apply fault at the Anadarko 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
45	FLT_045_ANADARK4_SWS4_138kV	3 phase fault on the Anadarko (520814) to S.W.S. (511477) 138kV line, near Anadarko. a. Apply fault at the Anadarko 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
46	FLT_046_WASHITA4_SWS4_138kV	3 phase fault on the Washita (521089) to S.W.S. (511477) 138kV line, near Washita. a. Apply fault at the Washita 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
47	FLT_047_SWS4_ELSWORTH4_138kV	3 phase fault on the S.W.S. (511477) to Elsworth (511563) 138kV line, near S.W.S. . a. Apply fault at the S.W.S. 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
48	FLT_048_SWS4_NORGE4_138kV	3 phase fault on the S.W.S. (511477) to Norge (511483) 138kV line, near S.W.S. . a. Apply fault at the S.W.S. 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
49	FLT_049_GRACMNT7_LES7_345kV	3 phase fault on the Gracemont (515800) to L.E.S. (511468) 345kV line, near Gracemont. a. Apply fault at the Gracemont 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
50	FLT_050_LES7_LES4_345_138kV	3 phase fault on the L.E.S. (511468) 345kV to L.E.S. (511467) 138kV to L.E.S. (511414) 13.8kV transformer circuit 1, near the 345kV bus. a. Apply fault at the L.E.S. 345kV bus. b. Clear fault after 5 cycles by tripping the faulted transformer.
51	FLT_051_LES4_FLETAP4_138kV	3 phase fault on the L.E.S. (511467) to Fle Tap (511423) 138kV line, near L.E.S. a. Apply fault at the L.E.S. 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
52	FLT_052_LES4_SHERID4_138kV	3 phase fault on the L.E.S. (511467) to Sherid (511474) 138kV line, near L.E.S. a. Apply fault at the L.E.S. 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Table 3-1: Contingencies Evaluated

Cont. No.	Contingency Name	Description
53	FLT_053_LES4_COMANC4_138kV	3 phase fault on the L.E.S. (511467) to Comanc (511437) 138kV line, near L.E.S. a. Apply fault at the L.E.S. 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
54	FLT_054_LES7_OKU7_345kV	3 phase fault on the L.E.S. (511468) to O.K.U. (511456) 345kV line, near L.E.S. a. Apply fault at the L.E.S. 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
55	FLT_055_LES7_G14057T_345kV	3 phase fault on the L.E.S. (511468) to G14-057/ Tap (560013) 345kV line, near L.E.S. a. Apply fault at the L.E.S. 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
56	FLT_056_G14057T_SUNNYSD7_345kV	3 phase fault on the G14-057 Tap (560013) to Sunny SD (515136) 345kV line, near G14-057 Tap. a. Apply fault at the G14-057 Tap 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
57	FLT_057_SUNNYSD7_SUNNYSD4_345_138kV	3 phase fault on the Sunny SD (515136) 345kV to Sunny SD (515135) 138kV to Sunny SD (515405) 13.8kV transformer circuit 1, near the 345kV bus. a. Apply fault at the Sunny SD 345kV bus. b. Clear fault after 5 cycles by tripping the faulted transformer.
58	FLT_058_SUNNYSD7_G16063TAP_345kV	3 phase fault on the Sunny SD (515136) to G16-063 TAP (560088) 345kV line, near Sunny SD. a. Apply fault at the Sunny SD 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
59	FLT_059_JOHNCO7_PITTSB7_345kV	3 phase fault on the Johnco (514809) to PITTSB (510907) 345kV line, near Johnco. a. Apply fault at the Johnco 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
60	FLT_060_PITTSB7_SEMINOL7_345kV	3 phase fault on the PITTSB (510907) to Seminol (515045) 345kV line, near PITTSB. a. Apply fault at the PITTSB 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
61	FLT_061_PITTSB7_VALIANT7_345kV	3 phase fault on the PITTSB (510907) to Valiant (510911) 345kV line, near PITTSB. a. Apply fault at the PITTSB 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
62	FLT_062_PITTSB7_CRIVER7_345kV	3 phase fault on the PITTSB (510907) to C River (515422) 345kV line, near PITTSB. a. Apply fault at the PITTSB 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
63	FLT_063_OKU7_G14074TAP_345kV	3 phase fault on the O.K.U. (511456) to G14-074-Tap (560027) 345kV line, near O.K.U. a. Apply fault at the O.K.U. 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
64	FLT_064_TUCOINT7_TUCOINT6_345_230kV	3 phase fault on the TUCO_Int (525832) 345kV to TUCO_Int (525830) 230kV to TUCO_Int (525824) 13.2kV transformer circuit 1, near the 345kV bus. a. Apply fault at the TUCO_Int 345kV bus. b. Clear fault after 5 cycles by tripping the faulted transformer.
65	FLT_065_TUCOINT7_BORDER7_345kV	3 phase fault on the TUCO_Int (525832) to Border (515458) 345kV line, near TUCO_Int. a. Apply fault at the TUCO_Int 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Table 3-1: Contingencies Evaluated

Cont. No.	Contingency Name	Description
66	FLT_066_BORDER7_WWRDEHV7_345kV	3 phase fault on the Border (515458) to Woodward (515375) 345kV line, near Border. a. Apply fault at the Border 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
67	FLT_067_TUCOINT7_YOAKUM345_345kV (25SP only)	3 phase fault on the TUCO_Int (525832) to Yoakum (526936) 345kV line, near TUCO_Int. a. Apply fault at the TUCO_Int 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
68	FLT_068_TUCOINT6_SWISHER6_230kV	3 phase fault on the TUCO_Int (525830) to Swisher (525213) 230kV line, near TUCO_Int. a. Apply fault at the TUCO_Int 230kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
69	FLT_069_TUCOINT6_CARLISLE6_230kV	3 phase fault on the TUCO_Int (525830) to Carlisle (526161) 230kV line, near TUCO_Int. a. Apply fault at the TUCO_Int 230kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
70	FLT_070_MINCO7_CIMARON7_345kV	3 phase fault on the Minco (514801) to Cimarron (514901) 345kV line, near Minco. a. Apply fault at the Minco 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
71	FLT_071_TUCOINT6_TOLKEAST6_230kV	3 phase fault on the TUCO_Int (525830) to TOLK_EAST (525524) 230kV line, near TUCO_Int. a. Apply fault at the TUCO_Int 230kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
72	FLT_072_TUCOINT6_JONES6_230kV	3 phase fault on the TUCO_Int (525830) to Jones (526337) 230kV line, near TUCO_Int. a. Apply fault at the TUCO_Int 230kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
73	FLT_073_YOAKUM345_HOBBSINT7_345kV (25SP Only)	3 phase fault on the Yoakum (526936) to HOBBS_INT (527896) 345kV line, near Yoakum. a. Apply fault at the Yoakum 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
74	FLT_074_CIMARON7_MATHWSN7_345kV	3 phase fault on the Cimarron (514901) to Mathewson (515497) 345kV line, CKT 1, near Cimarron. a. Apply fault at the Cimarron 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
75	FLT_075_DBLCIMARON7_MATHWSN7_345kV	3 phase fault on the Cimarron (514901) to Mathewson (515497) 345kV CKT 1 & 2, near Cimarron. a. Apply fault at the Cimarron 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).
76	FLT_076_CIMARON7_NORTWST7_345kV	3 phase fault on the Cimarron (514901) to Northwest (514880) 345kV line, near Cimarron. a. Apply fault at the Cimarron 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
77	FLT_077_CIMARON7_DRAPER7_345kV	3 phase fault on the Cimarron (514901) to Draper (514934) 345kV line, near Cimarron. a. Apply fault at the Cimarron 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
78	FLT_078_NORTWST7_ARCADIA7_345kV	3 phase fault on the Northwest (514880) to Arcadia (514908) 345kV line, near Northwest. a. Apply fault at the Northwest 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Table 3-1: Contingencies Evaluated

Cont. No.	Contingency Name	Description
79	FLT_079_NORTWST7_SPRNGCK7_345kV	3 phase fault on the Northwest (514880) to SPRNGCK (514881) 345kV line, near Northwest. a. Apply fault at the Northwest 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
80	FLT_080_DRAPER7_SEMINOL7_345kV	3 phase fault on the Draper (514934) to Seminol (515045) 345kV line, CKT 1 near Draper. a. Apply fault at the Draper 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
81	FLT_081_SEMINOL7_MUSKOGE7_345kV	3 phase fault on the Seminol (515045) to Muskoge (515224) 345kV line, near Seminol. a. Apply fault at the Seminol 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
82	FLT_082_REDBUD7_RSS7_345kV	3 phase fault on the Redbud (514909) to R. S. S. (509782) 345kV line, near Redbud. a. Apply fault at the Redbud 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
83	FLT_083_MATHWSN7_G15063T_345kV	3 phase fault on the Mathewson (515497) to G15-063 Tap (560055) 345kV line, near Mathewson. a. Apply fault at the Mathewson 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
84	FLT_084_WOODRNG7_HUNTERS7_345kV	3 phase fault on the WOODRNG (514715) to Hunters (515476) 345kV line, near WOODRNG. a. Apply fault at the WOODRNG 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
85	FLT_085_WOODRNG7_G16061TAP_345kV	3 phase fault on the WOODRNG (514715) to G16-061-TAP (560084) 345kV line, near WOODRNG. a. Apply fault at the WOODRNG 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
86	FLT_086_MATHWSN7_TATONGA7_345kV	3 phase fault on the Mathewson (515497) to Tatonga (515407) 345kV line, CKT 1, near Mathewson. a. Apply fault at the Mathewson 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
87	FLT_087_DBLMATHWSN7_TATONGA7_345kV (25SP Only)	3 phase fault on the Mathewson (515497) to Tatonga (515407) 345kV CKT 1 & 2, near Mathewson. a. Apply fault at the Mathewson 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).
88	FLT_088_TATONGA7_G11051TAP_345kV	3 phase fault on the Tatonga (515407) to G11-051-TAP (562075) 345kV line, CKT 1, near Tatonga. a. Apply fault at the Tatonga 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
89	FLT_089_DBLTATONGA7_G11051TAP_345kV (25SP only)	3 phase fault on the Tatonga (515407) to G11-051-TAP (562075) 345kV CKT 1 & 2, near Tatonga. a. Apply fault at the Tatonga 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).
90	FLT_090_ARCADIA7_REDBUD7_345kV	3 phase fault on the Arcadia (514908) to Redbud (514909) 345kV line, CKT 1, near Arcadia. a. Apply fault at the Arcadia 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
91	FLT_091_DBLARCADIA7_REDBUD7_345kV	3 phase fault on the Arcadia (514908) to Redbud (514909) 345kV CKT 1 & 2, near Arcadia. a. Apply fault at the Arcadia 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).
92	FLT_092_WTHWF4_CLNGTP4_138kV	3 phase fault on the Weatherford (511506) to Clinton Junction (511534) 138kV line, near Weatherford. a. Apply fault at the Weatherford 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Table 3-1: Contingencies Evaluated

Cont. No.	Contingency Name	Description
93	FLT_093_WTHWF4_WEATHTP4_138kV	3 phase fault on the Weatherford (511506) to Weatherford Tap (511536) 138kV line, near Weatherford. a. Apply fault at the Weatherford 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
94	FLT_094_WEATHTP4_WTHSE4_138kV	3 phase fault on the Weatherford Tap (511536) to WTH SE (511497) 138kV line, near Weatherford Tap. a. Apply fault at the Weatherford Tap 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
95	FLT_095_WTHSE4_WTHSE2_138_69kV	3 phase fault on the WTH SE (511497) 138kV to WTH SE (511496) 69kV to WTH SE (511505) 13.8kV transformer, near WTH SE 138kV. a. Apply fault at the WTH SE 138kV bus. b. Clear fault after 5 cycles by tripping the faulted transformer.
96	FLT_096_WTHSE4_WTHJCT4_138kV	3 phase fault on the WTH SE (511497) to WTH JCT (511489) 138kV line, near WTH SE. a. Apply fault at the WTH SE 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
97	FLT_097_CANGAS4_JENSEN4_138kV	3 phase fault on the CAN GAS (511540) to JENSEN (514821) 138kV line, near CAN GAS. a. Apply fault at the CAN GAS 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
98	FLT_098_CLNGTP4_CLINTJC4_138kV	3 phase fault on the Clinton Junction Tap (511534) to Clinton Junction (511485) 138kV line, near Clinton Junction Tap (511534). a. Apply fault at the Clinton Junction Tap (511534) 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
99	FLT_099_CLINTJC4_CLINTJC2_138_69kV	3 phase fault on the Clinton Junction (511485) 138kV to Clinton Junction (511484) 69kV to Clinton Junction (511499) 13.8kV transformer, near Clinton Junction 138kV. a. Apply fault at the Clinton Junction 138kV bus. b. Clear fault after 5 cycles by tripping the faulted transformer.
100	FLT_100_CLINTJC4_CLINTON4_138kV	3 phase fault on the Clinton Junction (511485) to Clinton (520856) 138kV line, near Clinton Junction. a. Apply fault at the Clinton Junction 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
101	FLT_101_CLINTJC4_ELKCTY4_138kV	3 phase fault on the Clinton Junction (511485) to Elk City (511458) 138kV line, near Clinton Junction. a. Apply fault at the Clinton Junction 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
102	FLT_102_WASHITA4_ONEY4_138kV	3 phase fault on the ONEY (521017) to Washita (521089) 138kV line, near Washita. a. Apply fault at the Washita 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
103	FLT_103_PO1GRANITE2_OMMANGM2_69kV	**Prior Outage Scenario 1** a. Prior Outage: Switch out the Carter J (520846) to LK Creek (520978) 69 kV line. b. Apply a 3 phase fault on the Granite (520927) to OMMANGM2 (529342) 69 kV line, near Granite. c. Clear fault after 5 cycles by tripping the faulted line d. Wait 20 cycles, and then re-close the line in (b) back into the fault. e. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
104	FLT_104_PO2GRANITE2_LKCREEK2_69kV	**Prior Outage Scenario 2** a. Prior Outage: Switch out the Russell (521042) to Altus (520803) 69 kV line. b. Apply a 3 phase fault on the Granite (520927) to LK Creek (520978) 69 kV line, near Granite. c. Clear fault after 5 cycles by tripping the faulted line d. Wait 20 cycles, and then re-close the line in (b) back into the fault. e. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Table 3-1: Contingencies Evaluated

Cont. No.	Contingency Name	Description
105	FLT_105_PO3GRANITE2_LKCREEK2_69kV	**Prior Outage Scenario 3** a. Prior Outage: Switch out the Vernon (521081) to Russell (521042) 69 kV line. b. Apply a 3 phase fault on the Granite (520927) to LK Creek (520978) 69 kV line, near Granite. c. Clear fault after 5 cycles by tripping the faulted line d. Wait 20 cycles, and then re-close the line in (b) back into the fault. e. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
106	FLT_106_SB1RUSSELL2_ALTUS2VERNON2_69KV	**Stuck Breaker Scenario 1** a. Apply a single phase fault on Russell (521042) 69 kV bus. b. Wait 16 cycles and remove fault. c. Trip Russell (521042) to Altus (520803)69 kV line. d. Trip Russell (521042) to Vernon (521081) 69 kV line.
107	FLT_107_PO4CHISHOLM7_CHISHOLM6_345_230kV	**Prior Outage Scenario 4** a. Prior Outage: Switch out the G16-037-Tap (560078) to Gracemont (515800) 345kV line. b. Apply a 3 phase fault on the Chisholm (511553) 345kV to Chisholm (511557) 230kV to Chisholm (511558) 13.8kV transformer, near Chisholm 345kV c. Clear fault after 5 cycles by tripping the faulted transformer
108	FLT_108_PO5GRACMNT7_MINCO7_345kV	**Prior Outage Scenario 5** a. Prior Outage: Switch out the G16-037-Tap (560078) to Chisholm (511553) 345kV line. b. Apply a 3 phase fault on the Gracemont (515800) to Minco 345kV line, near Gracemont. c. Clear fault after 5 cycles by tripping the faulted line. d. Wait 20 cycles, and then re-close the line in (b) back into the fault. e. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
109	FLT_109_SB2CHISHOLM7_WWRDEHV7_345kV	**Stuck Breaker Scenario 2** a. Apply a single phase fault on Chisholm (511553) 345kV bus. b. Wait 16 cycles and remove fault. c. Trip the Chisholm (511553) to Woodward (515375) 345kV line. d. Trip Chisholm (511553) 345kV to Chisholm (511557) 230kV to Chisholm (511558) 13.8kV transformer.
110	FLT_110_SB3GRACMNT7_G16037TAPMINCO7_345kV	**Stuck Breaker Scenario 3** a. Apply a single phase fault on Gracemont (515800) 345kV bus. b. Wait 16 cycles and remove fault. c. Trip Gracemont (515800) to G16-037-Tap (560078) 345kV line. d. Trip Gracemont (515800) to Minco (514801) 345kV line.
111	FLT_111_PO6WTHWF4_WEATHTP4_138kV	**Prior Outage Scenario 6** a. Prior Outage: Switch out the Clinton Junction (511485) to Elk City (511458) 138kV line. b. Apply a 3 phase fault on the Weatherford (511506) to Weatherford Tap (511536) 138kV line, near Weatherford. c. Clear fault after 5 cycles by tripping the faulted line. d. Wait 20 cycles, and then re-close the line in (b) back into the fault. e. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
112	FLT_112_PO7WTHWF4_CLNGTP4_138kV	**Prior Outage Scenario 7** a. Prior Outage: Switch out the WTH SE (511497) to WTH JCT (511489) 138kV line. b. Apply a 3 phase fault on the Weatherford (511506) to Clinton Junction (511534) 138kV line, near Weatherford. c. Clear fault after 5 cycles by tripping the faulted line and. d. Wait 20 cycles, and then re-close the line in (b) back into the fault. e. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
113	FLT_113_SB4CLINTJC4_ELKCTY4CLINTON4_138kV	**Stuck Breaker Scenario 4** a. Apply a single phase fault on Clinton Junction (511485) 138kV bus. b. Wait 16 cycles and remove fault. c. Trip Clinton Junction (511485) to Elk City (511458) 138kV line. d. Trip Clinton Junction (511485) to Clinton (520856)138kV line.
114	FLT_114_SUNNYSD7_JOHNCO7_345kV	3 phase fault on the Sunny SD (515136) to Johnco (514809) 345kV line, near Sunny SD. a. Apply fault at the Sunny SD 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
115	FLT_115_CHISHOLM7_BORDER7_345kV	3 phase fault on the Chisholm (511553) to Border (515458) 345kV line, near Chisholm. a. Apply fault at the Chisholm 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Table 3-1: Contingencies Evaluated

Cont. No.	Contingency Name	Description
116	FLT_116_CHISHOLM7_WWRD EHV7_345kV	3 phase fault on the Chisholm (511553) to Woodward (515375) 345kV line, near Chisholm. a. Apply fault at the Chisholm 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Results

The stability analysis was performed and the results are summarized in **Table 3-2**. The stability plots will be available upon customer request.

[1] Requires GEN-2016-008 to install extended frequency protection
[2] Requires GEN-2008-037 over-voltage protection at 1.2 pu trip time setting extended from 0.08 to 2.0
[3] Requires rerouting the Woodward to Border 345 kV line to tie into the proposed Chisholm 345 kV substation
[4] Requires disabling SLNOS1 relay on Wheeler-Sweetwater(State-line demarcation) 230 kV to prevent tripping of circuit
[5] Requires GEN-2006-035 under-voltage protection trip #7 setting adjusted from 0.0 pu to 0.9 pu and trip time adjusted from 0.06 to 2.55
[6] Requires curtailment of GEN-2016-008
[7] Requires curtailment of GEN-2016-051

FERC LVRT Compliance

FERC Order #661A places specific requirements on wind farms through its Low Voltage Ride Through (LVRT) provisions. For Interconnection Agreements signed after December 31, 2006, wind farms shall stay on line for faults at the POI that draw the voltage down at the POI to 0.0 pu. The faults listed below in ***Table 3-3*** were tested to meet Order 661A LVRT provisions. The results are listed in **Table 3-2**.

Table 3-3 LVRT Contingencies

Contingency Number and Name	Description
FLT_001_GRANITE2_LKCREEK2_69kV	3 phase fault on the Granite (520927) to LK Creek (520978) 69 kV line, near Granite. a. Apply fault at the Granite 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
FLT_002_GRANITE2_OMMANGM2_69kV	3 phase fault on the Granite (520927) to OMMANGM2 (529342) 69 kV line, near Granite. a. Apply fault at the Granite 69 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
FLT_030_G16037TAP_CHISHOLM7_345kV	3 phase fault on the G16-037-Tap (560078) to Chisholm (511553) 345 kV line, near G16-037-Tap. a. Apply fault at the G16-037-Tap 345 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
FLT_031_G16037TAP_GRACMNT7_345kV	3 phase fault on the G16-037-Tap (560078) to Gracemont (515800) 345 kV line, near G16-037-Tap. a. Apply fault at the G16-037-Tap 345 kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
FLT_092_WTHWF4_CLNGTP4_138kV	3 phase fault on the Weatherford (511506) to Clinton Junction (511534) 138kV line, near Weatherford. a. Apply fault at the Weatherford 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
FLT_093_WTHWF4_WEATHTP4_138kV	3 phase fault on the Weatherford (511506) to Weatherford Tap (511536) 138kV line, near Weatherford. a. Apply fault at the Weatherford 138kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

4. Power Factor Analysis

The power factor analysis was performed for each project included in this study and is designed to demonstrate the reactive power requirements at the point of interconnection (POI) using the current study upgrade cases. For all projects that require reactive power, the final requirement in the GIA will be the pro-forma 95% lagging to 95% leading at the POI.

Model Preparation

For each project included in this study, as well as previous queued projects modeled at the same POI, the projects were turned off for the power factor analysis. The projects were replaced by an equivalent generator located at the POI producing the total MW of the project at that POI and 0.0 Mvar capability.

A Mvar generator without limits was modeled at the interconnection project POI to hold a voltage schedule at the POI consistent with the greater of the voltage schedule in the base case or unity (1.0 pu) voltage.

Disturbances

Each N-1 contingency evaluated in the Stability Analysis found in ***Table 3-1*** was also included in the determination of the power factor requirements.

Results

The power factor ranges are summarized in **Table 4-1** and the resultant ranges are shown **Table D-1** for GEN-2016-008, **Table D-2** for GEN-2016-037, and **Table D-3** for GEN-2016-051. The analysis showed that reactive power is required for the study project, the final requirement in the Generation Interconnection Agreement (GIA) for each project will be the pro-forma 95% lagging to 95% leading at the POI.

For analyzing power factor results a positive Q (Mvar) output indicts that the equivalent generator is supplying reactive power to the system, implying a lagging power factor. A negative Q (Mvar) output indicts that the equivalent generator is absorbing reactive power from the system, implying a leading power factor.

Table 4-1*:* Summary of Power Factor Analysis at the POI

Request	Capacity (MW)	Point of Interconnection (POI)	Fuel	Generator	Lagging (providing Mvars)	Leading (absorbing Mvars)
GEN-2016-008	40	Granite 69kV (520927)	Solar	Advanced Energy 500NX 0.5 MW solar inverters (587063)	0.95	0.95
GEN-2016-037	300	Tap Chisholm (511553) – Gracemont (515800) 345kV, (G16-037-TAP, 560078)	Wind	Vestas V110 2.0 MW (587233)	0.95	0.95

Table 4-1*:* Summary of Power Factor Analysis at the POI

Request	Capacity (MW)	Point of Interconnection (POI)	Fuel	Generator	Lagging (providing Mvars)	Leading (absorbing Mvars)
GEN-2016-051	9.8 (uprate of GEN-2003-022 & GEN-2004-020; Total power = 156.8 MW)	Tap Clinton Junction (511534) – Weatherford Southeast (511536) 138kV, (WTH WF 138kV, 511506)	Wind	GE 1.6 MW (579363)	0.95	0.95

NOTE: As reactive power is required for all projects, the final requirement in the GIA will be the pro-forma 95% lagging to 95% leading at the point of interconnection.

5. Reduced Wind Generation Analysis

A low wind analysis has been performed for the GEN-2016-008, GEN-2016-037, & GEN-2016-051 Interconnection Requests. SPP performed this low wind analysis for excessive capacitive charging current for the addition of the Interconnection Request facilities. The high side of the each Interconnection Customer's transformer will interconnect to The Point of Interconnection (POI).

The POI for GEN-2016-008 will be at the existing Granite 69 kV station interconnected by an approximate less than one (1) mile overhead 69 kV transmission line, GEN-2016-037 will be at a new 345 kV substation tapping the proposed Chisholm – Gracemont 345 kV line interconnected by an approximately five (5) mile overhead 345 kV transmission line, & GEN-2016-051 will be at the existing Weatherford Windfarm Tap a 138kV station built for the GEN-2003-022 & GEN-2004-020 interconnection requests tapping Clinton Junction – Weatherford Southeast 138kV line.

The project generators and capacitors (if any) were turned off in the base case. The resulting reactive power injection into the transmission network comes from the capacitance of the project's transmission lines and collector cables is shown in **Figure E-1** for GEN-2016-008, **Figure E-3** for GEN-2016-037, and **Figure E-5** for GEN-2016-051. Shunt reactors were added at the study project substation 34.5 kV bus to bring the Mvar flow into the POI down to approximately zero as show in **Figure E-2** for GEN-2016-008, **Figure E-4** for GEN-2016-037, and **Figure E-6** for GEN-2016-051.

Final shunt reactor requirement for each project with the model information provided to SPP is shown in **Table 5-1**. It is the interconnection customer's responsibility to design and install the reactive compensation equipment necessary to control the reactive power injection at the POI. If an equivalent means of compensation is installed, the reactive power required may vary with system conditions (e.g. a higher compensation amount is required for voltages above unity at the POI and a lower compensation amount is required for voltages below unity at the POI).

Table 5-1*:* Summary of Reduced Wind Generation Analysis

Request	Point of Interconnection (POI)	Reactor Size (Mvar)
GEN-2016-008	Granite 69kV (520927)	0.5
GEN-2016-037	Tap Chisholm (511553) – Gracemont (515800) 345kV, (G16-037-TAP, 560078)	29.8
GEN-2016-051	Tap Clinton Junction (511534) – Weatherford Southeast (511536) 138kV, (WTH WF 138kV, 511506)	0.5

6. Short Circuit Analysis

The short circuit analysis was performed on the 2017 & 2025 Summer Peak power flow cases using the PSS/E ASCC program. Since the power flow model does not contain negative and zero sequence data, only three-phase symmetrical fault current levels were calculated at the point of interconnection up to and including five levels away.

Short Circuit Analysis was conducting using flat conditions with the following PSS/E ASCCC program settings:

- BUS VOLTAGES SET TO 1 PU AT 0 PHASE ANGLE
- GENERATOR P=0, Q=0
- TRANSFORMER TAP RATIOS=1.0 PU and PHASE ANGLES=0.0
- LINE CHARGING=0.0 IN +/-/0 SEQUENCE
- LOAD=0.0 IN +/- SEQUENCE, CONSIDERED IN ZERO SEQUENCE
- LINE/FIXED/SWITCHED SHUNTS=0.0 AND MAGNETIZING ADMITTANCE=0.0 IN +/-/0 SEQUENCE
- DC LINES AND FACTS DEVICES BLOCKED
- TRANSFORMER ZERO SEQUENCE IMPEDANCE CORRECTIONS IGNORED

Results

The results of the short circuit analysis are shown in **Appendix F; Table F-1** for GEN-2016-008, **Table F-2** for GEN-2016-037, and **Table F-3** for GEN-2016-051.

7. Conclusion

DISIS-2016-001 Group 7 Interconnection Customer(s) have requested an Impact Study to determine the impacts of interconnecting generation to the SPP Transmission System.

A stability cluster impact analysis was performed for the generation projects from the DISIS-2016-001 Group 7 study. The analysis was performed on three (3) seasonal models including 2016 winter peak (16WP), the 2017 summer peak (17SP), and the 2025 summer peak (25SP) cases. These cases are modified versions of the 2015 model series of Model Development Working Group (MDWG) dynamic study models. A total of one-hundred sixteen (116) contingencies were evaluated for the three (3) seasonal cases.

The stability analysis has determine with all previously assigned network upgrades, rerouting the Woodward to Border 345 kV line to tie into the proposed Chisholm 345 kV substation, GEN-2016-008 installing the extended frequency protection option, and resetting the protective relays on the Wheeler to Sweetwater 230kV line, all generators in the monitored areas remained stable and within the pre-contingency, voltage recovery, and post fault voltage recovery criterion of 0.7pu to 1.2pu for the entire modeled disturbances. Under certain system conditions the interconnection requests may be required to curtail generation output to maintain system reliability.

In addition to the cluster impact stability analysis, a stand-alone stability analysis was conducted for each request. This analysis demonstrated that GEN-2016-008 must install the extended frequency protection option, GEN-2016-037 requires rerouting the Woodward to Border 345 kV line to tie into the proposed Chisholm 345 kV substation and the protective relays on the Wheeler to Sweetwater 230kV line to be reset.

Power factor analysis for each generation project was performed on the current study 2016 winter peak, 2017 summer peak, and 2025 summer peak cases with identified system upgrades. As reactive power is required for all projects, the final requirement in the GIA will be the pro-forma 95% lagging to 95% leading at the point of interconnection.

A reduced generation analysis was conducted for wind farms to determine reactor size necessary to compensate the capacitive effects on the transmission system during low or reduced wind conditions caused by the interconnecting project's generator lead transmission line and collector systems. Each request may be required to install the following reactors on their facilities: GEN-2016-008 – 0.5 Mvar, GEN-2016-037 – 29.8 Mvar, and GEN-2016-051 – 0.5 Mvar.

Short Circuit analysis was conducted using the current study 2025 summer peak case with identified system upgrades.

Nothing in this study should be construed as a guarantee of delivery or transmission service. If the customer wishes to sell power from the facility, a separate request for transmission service must be requested on Southwest Power Pool's OASIS by the Customer.

Appendix E – Reduced Wind Generation Analysis Results

Below figures are from the 2016WP model with identified upgrades in-service. The other two cases (2017SP and 2025SP) were almost identical since the Interconnection Request facilities design is the same in all cases.

Figure E-1*:* GEN-2016-008 with generators turned off

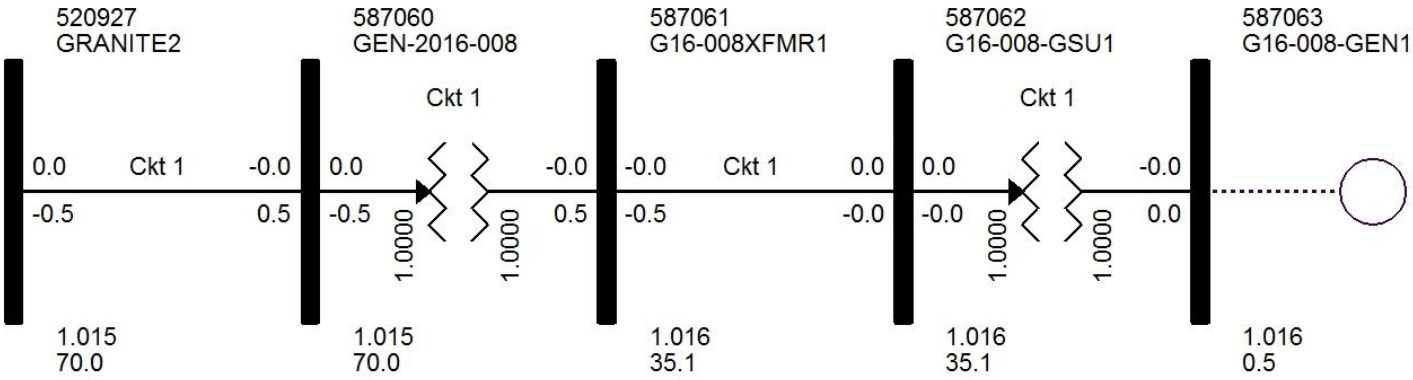

Figure E-2*:* GEN-2016-008 with generators turned off and shunt reactors added to the customer 34.5kV substation

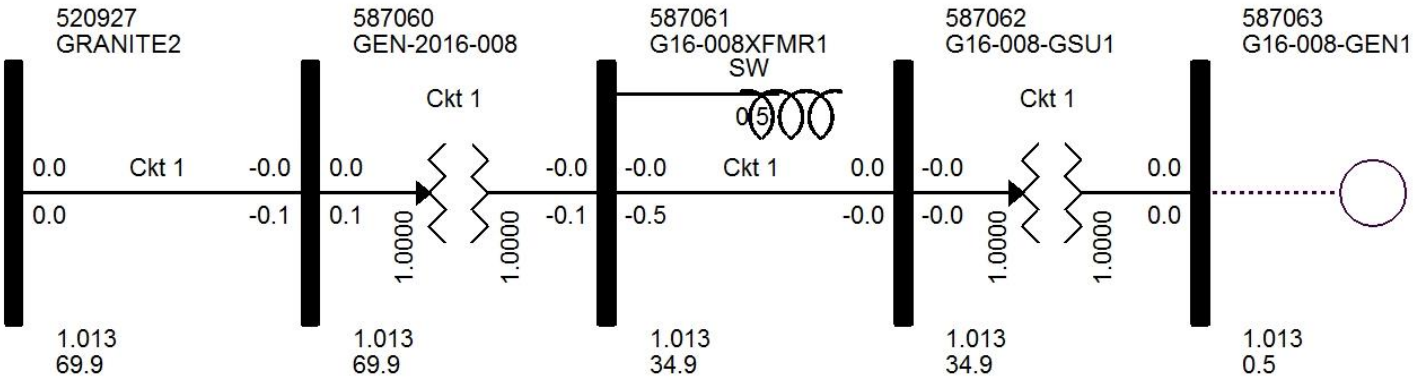

Figure E-3*:* GEN-2016-037 with generators turned off

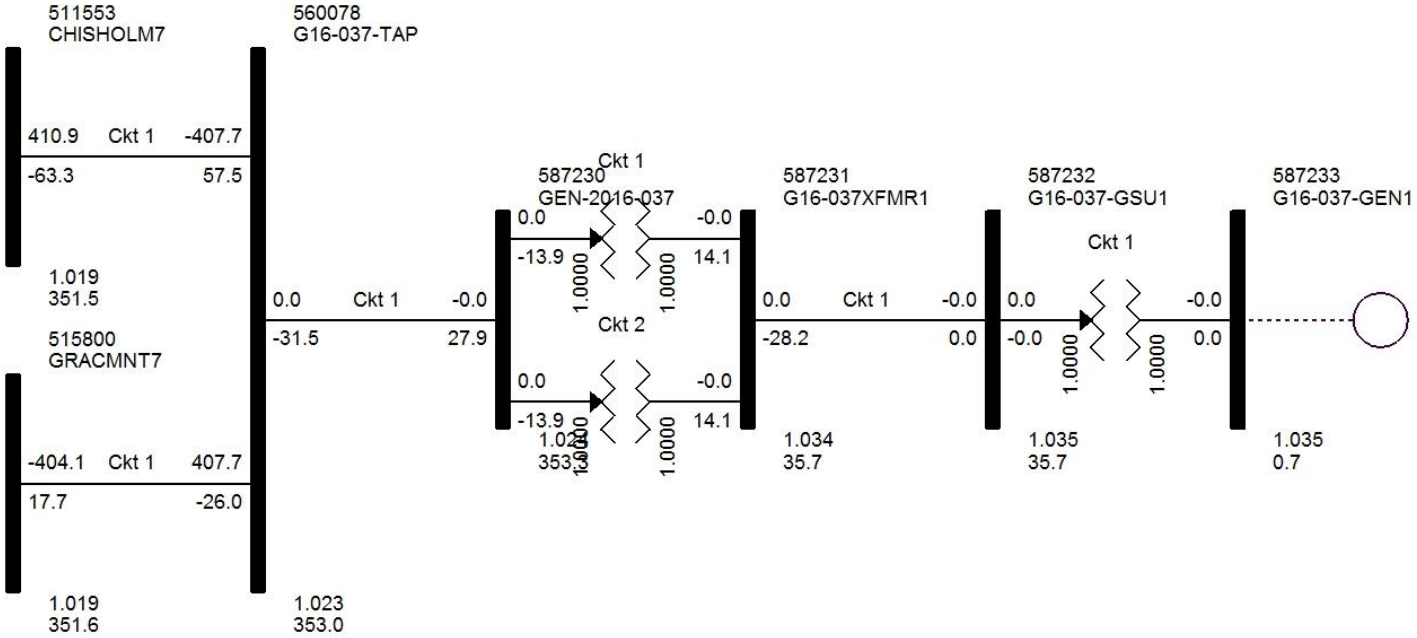

Figure E-4*:* GEN-2016-037 with generators turned off and shunt reactors added to the customer 34.5kV substation

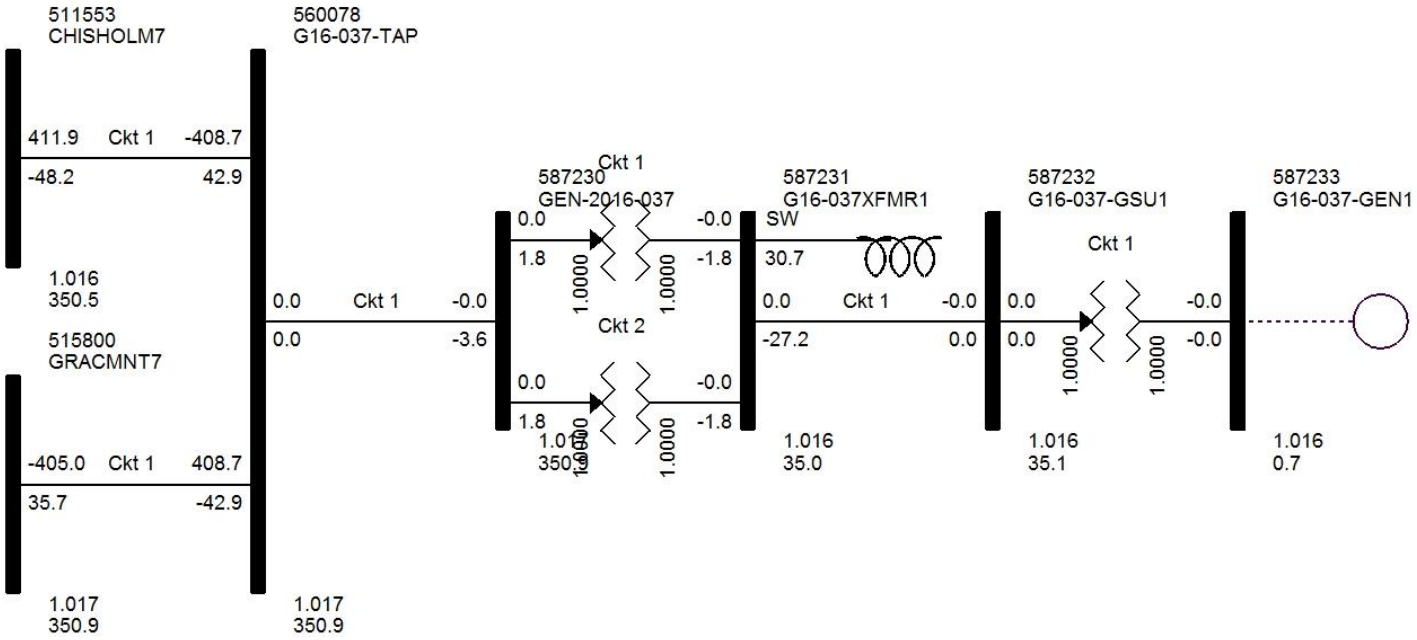

Figure E-5*:* GEN-2016-051 with generators turned off

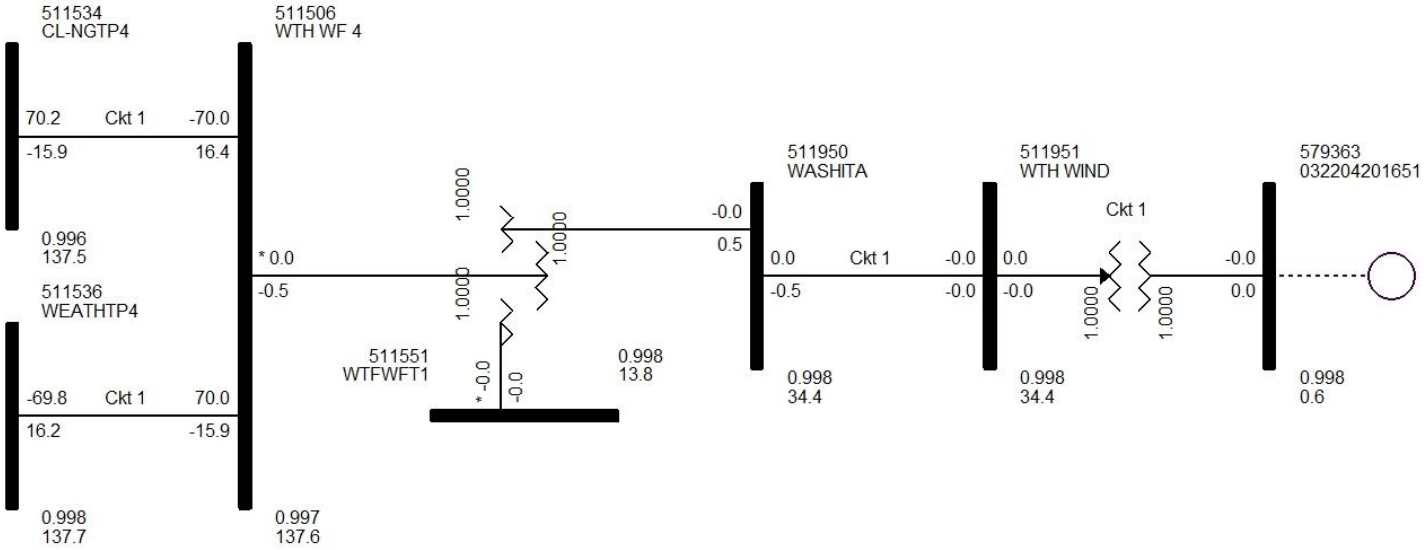

Figure E-6*:* GEN-2016-051 with generators turned off and shunt reactors added to the customer 34.5kV substation

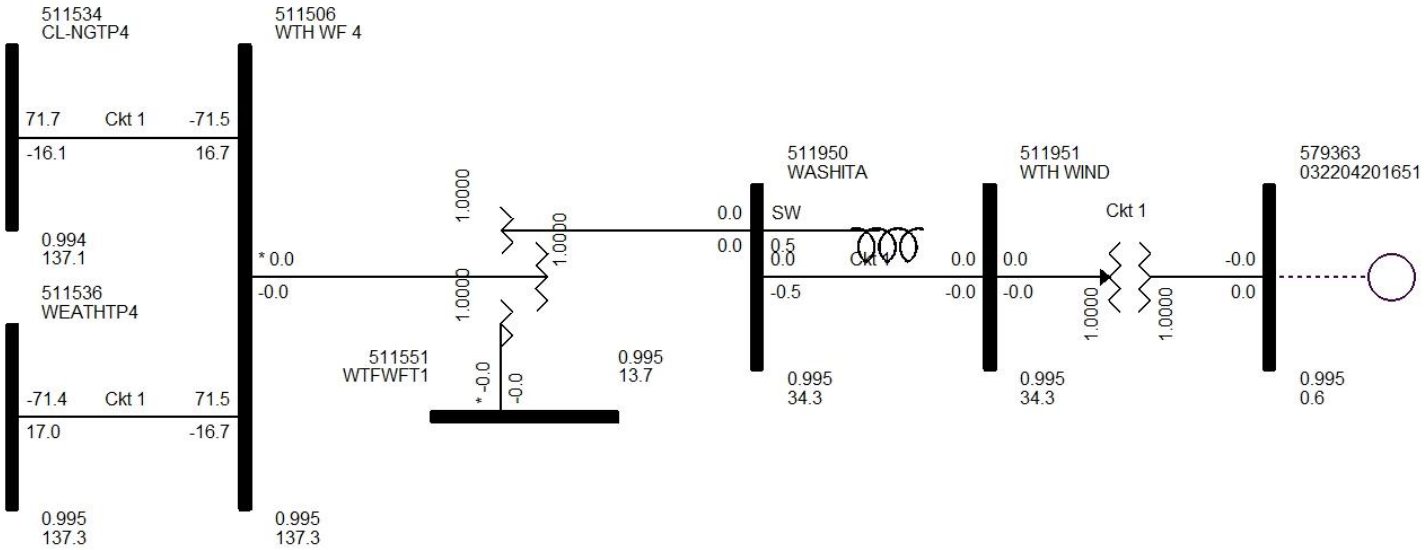

Appendix F – Short Circuit Analysis Results

DISIS-2016-001 (Group 08) Definitive Impact Study

Final Report

REP-0029
Revision #00

February 2017

Submitted By:
Mitsubishi Electric Power Products, Inc. (MEPPI)
Power Systems Engineering Services Department
Warrendale, PA

Title: **DISIS-2016-001 (Group 08) Definitive Impact Study: Final Report REP-0029**
Date: February 2017
Author: Marcus A. Young; Principal Engineer, Power Systems Engineering Dept. *Marcus A. Young*
Reviewed: Nicholas W. Tenza; Engineer II, Power Systems Engineering Dept. *Nicholas W. Tenza*
Approved: Rajat Majumder; Section Manager, Power Systems Engineering Dept. *Rajat Majumder*

EXECUTIVE SUMMARY

SPP requested a Definitive Interconnection System Impact Study (DISIS). The DISIS required a Stability Analysis, Short Circuit Analysis, Power Factor Analysis, and Low Wind/No Wind Analysis detailing the impacts of the interconnecting projects as shown in Table ES-1.

Table ES-1
Interconnection Projects Evaluated

Request	Size (MW)	Generator Model	Point of Interconnection
GEN-2016-009	29	GENROU (Steam; 587073, 587074)	Osage 69kV (514742)
GEN-2016-012	200	Vestas V110 2.0MW (wind; 587084)	Tap Waverly (532799) - La Cygne (542981) 345kV, (G16-012-TAP,560073)
GEN-2016-022	151.8	Vestas V126 3.45MW (wind; 587163)	Ranch Road 345kV (515576)
GEN -2016-024	55.86	Sunny Central 2940 2.67/2.94MW (solar; 587103)	Midian 138kV (532990)
GEN-2016-031	1.5MW uprate of GEN-2015-001 (total = 201.3MW)	Vestas V126 3.3MW (wind; 584453)	Ranch Road 345kV (515576)
GEN-2016-032	200	Vestas V110 2MW (wind; 587213)	Tap Marshall (514733)- Cottonwood Creek (514827) 138kV, (G16-032-TAP, 560077)
GEN -2016-048	82.32	Sunny Central 2940 2.94MW (solar; 587333)	Sooner 138kV (514802)
GEN-2016-060	25.3	G.E. 2.3MW (wind; 585203)	Belle Plain 138kV (533063)
GEN-2016-061	250.7	GE 2.3 MW (wind; 587413)	Tap Woodring (514715) – Sooner (514803) 345kV (G16-061-TAP, 560084)
GEN-2016-068	250	GE 2.0MW (wind; 587463)	Woodring 345kV (514715)
GEN-2016-071	200.1	GE 2.3MW (wind; 587483)	Chilocco 138kV (521198)
GEN-2016-072	300	Vestas V110 VCSS 2.0MW (wind; 587493)	Renfrow (515543) 345 kV
GEN-2016-073	220	GE 2.0MW (wind; 587503)	Tap on Thistle (539801) to Wichita (532796) 345kV, ckt1&2 (Buffalo Flats 345kV; 560033)

SUMMARY OF STABILITY ANALYSIS

The Stability Analysis determined that there were multiple contingencies that resulted in system instability, generation tripping offline, or voltage violations for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions when all generation interconnection requests were at 100% output.

The following system upgrades and adjustments are recommended:

- Addition of Wolf Creek to Neosho 345 kV line circuit #1 to improve voltage stability in the vicinity of Waverly and to mitigate tripping of project generators GEN-2016-012 and GEN-2016-024.
- Reduction of generation at GEN-2016-071 and GEN-2011-057 following prior outage of Middleton Tap to Peckham Tap 345 kV line for FLT123-PO (see Figure 3-15 for the amount of reduction in 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak) to mitigate instability and generator tripping.

SUMMARY OF THE SHORT CIRCUIT ANALYSIS

The Short Circuit Analysis was performed on the 2017 Summer Peak and 2025 Summer Peak power flow for all study projects. Refer to Table ES-2 and ES-3 for a list of maximum fault currents observed for each study project for the 2017 Summer Peak and 2025 Summer Peak Cluster Scenarios, respectively.

Table ES-2
List of Maximum Fault Currents Observed in 2017 Summer Peak Power Flow for Each Study Project

Study Project	Fault Current at POI (kA)	Maximum Fault Current (kA)	Fault Location	Bus Voltage (kV)
GEN-2016-009	5.66	9.98	CHIKASI2	69
GEN-2016-012	14.13	39.28	CRAIG 5	161

[1]Lagging power factors are negative and leading power factors are positive

SUMMARY OF LOW WIND/NO WIND ANALYSIS

The amount of reactive power injected into the transmission network was recorded at the point of interconnection for all study generators for each Cluster Scenario. The maximum reactance needed for zero Mvar flow was 34.7 Mvar for the line connecting GEN-2016-068 to the Woodring 345 kV line. The minimum reactance needed for zero Mvar flow was 0.1 Mvar for for the line connecting GEN-2016-009 to the Osage 69 kV line.

SECTION 1: OBJECTIVES

The objective of this report is to provide Southwest Power Pool, Inc. (SPP) with the deliverables for the DISIS-2016-001 (Group 08) Definitive Impact Study. SPP requested an Interconnection System Impact Study for thirteen (13) generation interconnections for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak, which requires a Stability Analysis, Short Circuit Analysis, Power Factor Analysis, Low Wind/No Wind Analysis, and an Impact Study Report.

SECTION 2: BACKGROUND

The Siemens Power Technologies, Inc. PSS/E power system simulation program Version 32.2.2 was used for this study. SPP provided the stability database cases for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and a list of contingencies to be examined. The model includes the study projects shown in Table 2-1 and the previously queued projects listed in Table 2-2. Refer to Appendix A for the steady-state and dynamic model data for the study projects. A power flow one-line diagram for each generation interconnection project is shown in Figures 2-1 through 2-12. Note that the one-line diagrams represent the 2025 Summer Peak case.

The Stability Analysis determined the impacts of the new interconnecting projects on the stability and voltage recovery of the nearby system and the ability of the interconnecting projects to meet FERC Order 661A. If problems with stability or voltage recovery are identified, the need for reactive compensation or system upgrades will be investigated. Three-phase faults and single line-to-ground faults will be examined as listed in Table 2-3. Note that all contingencies listed were examined for the cluster scenario, and specified contingencies (indicated by an X) were examined for each Stand Alone generator.

A Short Circuit Analysis was performed on the 2017 Summer Peak and 2025 Summer Peak study year for each study generator in the Cluster Scenario. The study was performed five buses out from the study generator's point of interconnection and results were documented.

The Power Factor Analysis determined the power factor at the point of interconnection for the wind or solar interconnection projects for pre-contingency and post-contingency conditions. The N-1, three phase contingencies listed in Table 2-3 were used in the Power Factor analysis.

The Low Wind/No Wind Analysis was completed for all wind or solar farm interconnections. This analysis determined if reactive support is needed to have an Mvar flow of approximately zero at the point of interconnection (POI).

SECTION 3: STABILITY ANALYSIS

The objective of the Stability Analysis was to determine the impacts of the generator interconnections on the stability and voltage recovery on the SPP transmission system. If problems with stability or voltage recovery were identified the need for reactive compensation or system upgrades were investigated.

3.1 Approach

SPP provided MEPPI with the following three power flow cases from the DISIS-2016-001 Group 08 study:

- 2016 Winter Peak
- 2017 Summer Peak
- 2025 Summer Peak

Each case was examined prior to the Stability Analysis to ensure the case contained the proposed study projects and any previously queued projects listed in Tables 2-1 and 2-2 respectively. There was no suspect power flow data in the study area. The dynamic datasets were also verified and stable initial system conditions (i.e., "flat lines") were achieved. Three-phase and single phase-to-ground faults listed in Table 2-3 were examined. Single-phase fault impedances were calculated for each season to result in a voltage of approximately 60% of the pre-fault voltage. Refer to Table 3-1 for a list of the calculated single-phase fault impedances used for the Cluster Scenario. Refer to Tables 3-2 through 3-14 for single-phase fault impedances used for each Stand Alone Scenario.

Table 3-1

*Refer to Table 2-3 for a description of the contingency scenerio

Bus voltages, machine rotor angles, and previously queued generation in the study area were monitored. Requested and previously queued generation outside the study area was also monitored.

The results of the analysis determined if reactive compensation or system upgrades were required to obtain acceptable system performance. If additional reactive compensation was required, the size, type, and location were determined. The proposed reactive reinforcements would ensure the wind or solar farm meets FERC Order 661A low voltage requirements and return the wind or solar farm to its pre-disturbance operating voltage. If the results indicated the need for fast responding reactive support, dynamic support such as an SVC or STATCOM was investigated. If tripping of the prior queued projects was observed during the stability analysis (for under/over voltage or under/over frequency) the simulations were re-ran with the prior queued project's voltage and frequency tripping disabled.

3.2 Cluster Scenario Stability Analysis Results

The Stability Analysis determined that there were multiple contingencies that resulted in system instability, generation tripping offline, or voltage violations for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions when all generation interconnection requests were at 100% output.

Refer to Table 3-15 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3. Table 3-15 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak cluster scenarios and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady-state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u. If high or low voltages were observed the number of buses failing the voltage criteria was listed.

Refer to Appendix B, Appendix C, and Appendix D for a complete set of plots for all contingencies for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions, respectively.

[1]Voltage Instability

To mitigate the system/voltage instability, voltage violations, generation tripping offline, and poor post-fault steady-state voltages, the following upgrades were provided by SPP and implemented in each season.

- Wolf Creek to Neosho 345 kV line circuit #1 to improve voltage stability in the vicinity of Waverly and to mitigate tripping of project generators GEN-2016-012 and GEN-2016-024.
- Reduction of generation at GEN-2016-071 and GEN-2011-057 following prior outage of Middleton Tap to Peckham Tap 345 kV line for FLT123-PO (see Figure 3-15 for the amount of reduction in 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak) to mitigate instability and generator tripping.

Table 3-16
Reduction of Generation following Prior Contingency for FLT123-PO

Project	Percent Reduction of Output		
	2016 Winter	2017 Summer	2025 Summer
GEN-2011-057	-	20%	20%
GEN-2016-071	20%	20%	20%

In addition to the upgrades above, adjustment of operating settings for GEN-2016-045 and GEN-2015-057, two interconnection requests being studied in Group 1 of DISIS-2016-001, were required for these projects to remain connected to the grid for certain contingencies in this study.

After the upgrades and adjustments were implemented, all violations were mitigated for the Cluster Scenarios.

Refer to Figure 3-1 for comparison of representative post-fault steady-state voltages in the Waverly area for FLT15-3PH for the 16WP Case. FLT15-3PH is a three-phase fault that results in the loss of the LaCygne to G16-012-Tap 345 kV line, which causes post-fault steady-state voltages below 0.9 p.u. in the vicinity of Waverly. The addition of the Wolf Creek to Neosho 345 kV line mitigates the voltage issue. This upgrade mitigates post-fault steady-state voltage issues and voltage instability within the vicinity of Waverly for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak cases.

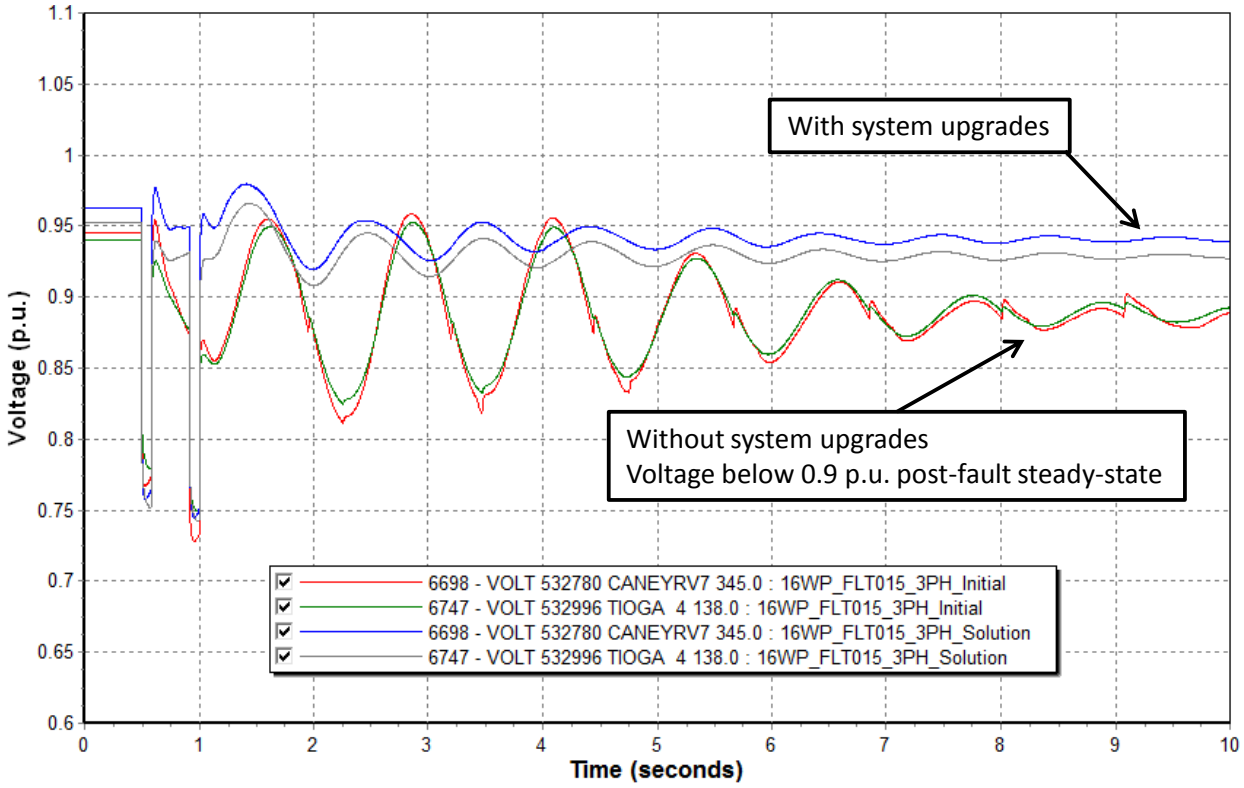

Figure 3-1: Representative plot of Waverly area voltages for FLT15-3PH for the 16WP case with and without system upgrade.

Refer to Figure 3-2 for comparison of representative post-fault steady-state voltages in the Slate Creek area for FLT123-PO for the 17SP case. FLT123-PO, a prior outage of the Middleton Tap to Peckham Tap 345 kV line, results in the loss of the Creswell to Oxford 138 kV line. The loss of these lines causes voltage instability in the vicinity of Slate Creek. Reduction of generation at GEN-2016-071 and GEN-2011-057 mitigates the voltage instability. This solution mitigates the voltage instability at Slate Creek for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak cases.

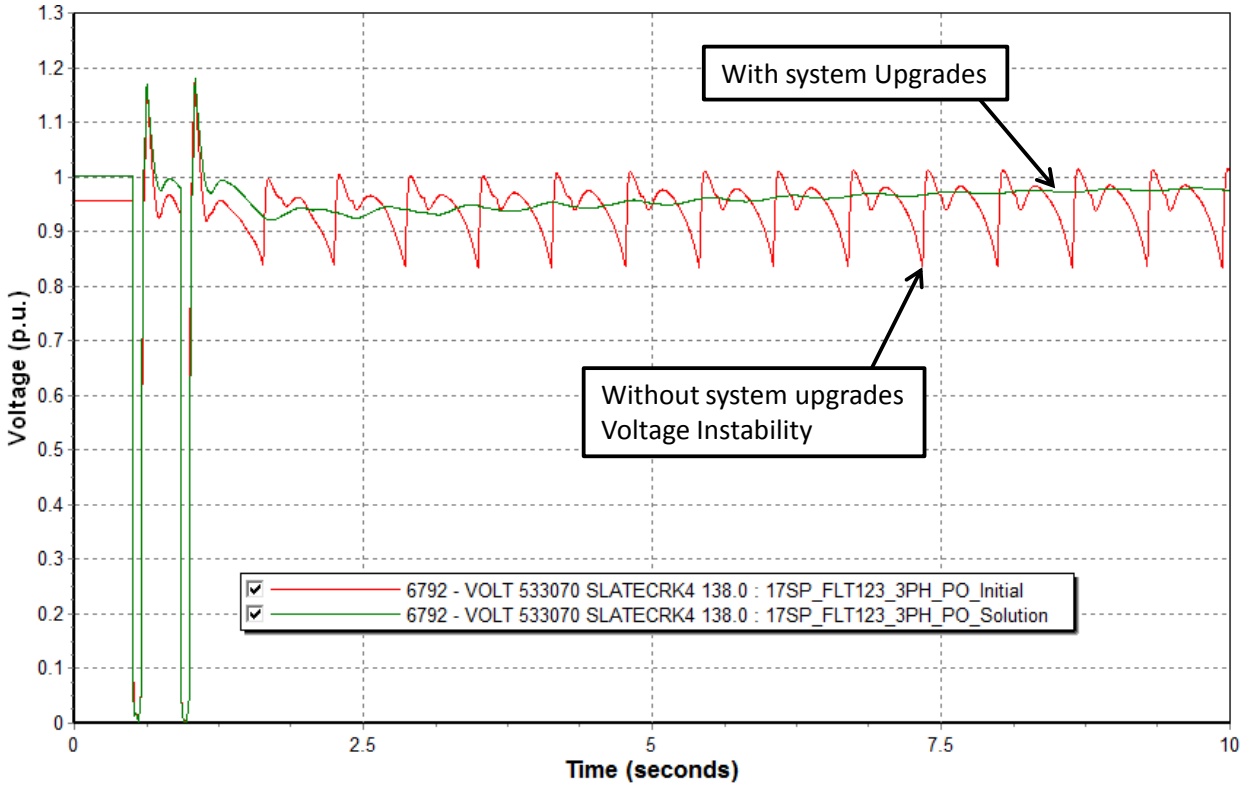

Figure 3-2: Representative plot of Slate Creek area voltage for FLT123-PO for the 16WP case with and without system upgrades.

3.3 Stand Alone Scenario Stability Analysis Results

Stand Alone Scenario Stability Analysis Results: GEN-2016-009

The Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions when GEN-2016-009 was at 100% output.

Refer to Table 3-17 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that correspond to the GEN-2016-009 Stand Alone Analysis. Table 3-17 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u. If high or low voltages were observed the number of buses failing the voltage criteria was listed.

Refer to Appendix E, Appendix F, and Appendix G for a complete set of plots for all the GEN-2016-009 Stand Alone Analysis contingencies for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions.

Stand Alone Scenario Stability Analysis Results: GEN-2016-012

The Stability Analysis determined that multiple contingencies result in system instability, generation tripping offline, or voltage violations for the 2016 Winter Peak and 2017 Summer Peak conditions when GEN-2016-012 was at 100% output. These issues are mitigated by application of the system upgrades described for the cluster scenarios.

Refer to Table 3-18 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-012 Stand Alone Analysis. Table 3-18 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u. If high or low voltages were observed the number of buses failing the voltage criteria was listed.

Refer to Appendix E, Appendix F, and Appendix G for a complete set of plots for all the GEN-2016-012 Stand Alone Scenario contingencies for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions.

[1]Voltage instability

To mitigate the voltage instability and low voltages, the solutions as described in the Cluster Scenario were implemented for GEN-2016-012. After the identified solutions were implemented, all violations were mitigated and there were no additional violations observed.

Stand Alone Scenario Stability Analysis Results: GEN-2016-022

The Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions when GEN-2016-022 was at 100% output.

Refer to Table 3-19 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-022 Stand Alone Analysis. Table 3-19 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u. If high or low voltages were observed the number of buses failing the voltage criteria was listed.

Refer to Appendix E, Appendix F, and Appendix G for a complete set of plots for all the GEN-2016-022 Stand Alone Scenario contingencies for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions.

Stand Alone Scenario Stability Analysis Results: GEN-2016-024

The Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions when GEN-2016-024 was at 100% output.

Refer to Table 3-20 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-024 Stand Alone Analysis. Table 3-20 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u. If high or low voltages were observed the number of buses failing the voltage criteria was listed.

Refer to Appendix G for a complete set of plots for all the GEN-2016-024 Stand Alone Scenario contingencies for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions.

Stand Alone Scenario Stability Analysis Results: GEN-2016-060

The Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions when GEN-2016-060 was at 100% output.

Refer to Table 3-24 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-060 Stand Alone Analysis. Table 3-24 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u. If high or low voltages were observed the number of buses failing the voltage criteria was listed.

Refer to Appendix E, Appendix F, and Appendix G for a complete set of plots for all the GEN-2016-060 Stand Alone Scenario contingencies for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions.

Stand Alone Scenario Stability Analysis Results: GEN-2016-061

The Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions when GEN-2016-061 was at 100% output.

Refer to Table 3-25 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-061 Stand Alone Analysis. Table 3-25 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u. If high or low voltages were observed the number of buses failing the voltage criteria was listed.

Refer to Appendix E, Appendix F, and Appendix G for a complete set of plots for all the GEN-2016-068 Stand Alone Scenario contingencies for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions.

Stand Alone Scenario Stability Analysis Results: GEN-2016-068

The Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions when GEN-2016-068 was at 100% output.

Refer to Table 3-26 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-068 Stand Alone Analysis. Table 3-26 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u. If high or low voltages were observed the number of buses failing the voltage criteria was listed.

Refer to Appendix E, Appendix F, and Appendix G for a complete set of plots for all the GEN-2016-068 Stand Alone Scenario contingencies for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions.

Stand Alone Scenario Stability Analysis Results: GEN-2016-071

The Stability Analysis determined that contingency FLT123-PO results in system instability, generation tripping offline, or voltage violations for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions when GEN-2016-071 was at 100% output. These issues are mitigated by curtailment of generation.

Refer to Table 3-27 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-071 Stand Alone Analysis. Table 3-27 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u. If high or low voltages were observed the number of buses failing the voltage criteria was listed.

Refer to Appendix E, Appendix F, and Appendix G for a complete set of plots for all the GEN-2016-071 Stand Alone Scenario contingencies for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions.

SECTION 4: SHORT CIRCUIT ANALYSIS

The objective of this task is to quantify the three-phase to ground fault currents for the 2017 Summer Peak and 2025 Summer Peak seasons for each interconnecting generator.

4.1 Approach

The short-circuit analysis will assess breaker adequacy and fault duties for the generator interconnection bus and five buses away from the point of interconnection. MEPPI will assume no outages to find maximum short-circuit currents that flow through the breaker. The Automatic Sequencing Fault Calculation (ASCC) function in PSS/E was utilized to perform this task. FLAT conditions were applied to pre-fault conditions and the following adjustments were utilized:

- All synchronous and asynchronous machine P and Q output was set to zero
- All transformer tap ratios were set to 1.0 p.u. and all phase shift angles were set to zero
- All generator reactance's were fixed to the subtransient reactance
- All line charging was set to zero
- All shunts were set to zero
- All loads were set to zero
- All pre-fault bus voltages were set to 1.0 p.u. and a phase shift angle of zero

4.2 Short Circuit Results

The maximum fault current for each bus is provided for the 2017 Summer Peak condition. The following tables show the short circuit results for the study generators:

- Table 4-1: Short Circuit Analysis for GEN-2016-009
- Table 4-2: Short Circuit Analysis for GEN-2016-012

SECTION 5: POWER FACTOR ANALYSIS

The objective of this task is to quantify the power factor at the point of interconnection for the wind farms during base case and system contingencies. SPP transmission planning practice requires interconnecting generation projects to maintain the power factor (pf) at the Point of Interconnection (POI) within +/- 0.95 pf for system intact conditions and for post-contingency conditions. This is analyzed by having the wind farm maintain a prescribed voltage schedule at the point of interconnection of 1.0 p.u. voltage, or if the pre-project voltage is higher than 1.0 p.u., to maintain the pre-project voltage schedule.

The 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak power flows provided by SPP, including any updates, were examined prior to the Power Factor Analysis to ensure they contained the proposed study project modeled at 100% of the nameplate rating and any previously queued projects listed in Table 2-2. There was no suspect power flow data in the study area. The proposed study project and any previously queued projects at the same point of interconnection were turned off during the power factor analysis. The wind farm(s) were then replaced by a generator modeled at the high side bus with the same real power (MW) capability as the wind farm(s) and open limits for the reactive power set points (Mvar). The generator was set to hold the POI scheduled bus voltage or 1.0 p.u., whichever was greater. All N-1, three-phase fault contingencies from Table 2-3 were then applied and the reactive power required to maintain the bus voltage was recorded.

5.1 Approach

GEN-2016-009 was disabled and a generator was placed at the study project's high side voltage bus. The generator was modeled with PGEN = 29 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. All buses, transformers, and equivalent lines connected from the study project's high side voltage bus to GEN-2016-0009 were disabled. The scheduled voltage was set to 1.0 p.u. for the 2016 Winter Peak case, 1.007 p.u. for the 2017 Summer Peak case, and 1.005 p.u. for the 2025 Summer Peak case.

GEN-2016-012 was disabled and a generator was placed at the study project's high side voltage bus. The generator was modeled with PGEN = 200 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. All buses, transformers, and equivalent lines connected from the study project's high side voltage bus to GEN-2016-012 were disabled. The scheduled voltage was set to 1.0 p.u. for the 2016 Winter Peak case, 1.0 p.u. for the 2017 Summer Peak case, and 1.0 p.u. for the 2025 Summer Peak case.

GEN-2015-033 and GEN-2014-074 were disabled in the power flow case. A generator was placed at the high side bus of GEN-2015-033 and modeled with PGEN = 152 MW, Qmin = -

9999 Mvar, Qmax = 9999 Mvar. A second generator was placed at the high side bus of GEN-2014-074 and modeled with PGEN = 152 MW, Qmin = -9999 Mvar, Qmax = 9999 Mvar. All buses and transformers connected from the high side bus of each project to the corresponding generator were disabled.

GEN-2016-022, GEN-2016-031, and GEN-2015-034 were all disabled in the power flow case. A generator was placed at the high side bus of GEN-2016-022 and modeled with PGEN = 151.8 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. A second study generator was placed at the high side bus of GEN-2016-031 and modeled with PGEN = 201.3 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. A third generator was placed at the high side bus of GEN-2015-034 and modeled with PGEN = 200.0 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. All buses, transformers, and equivalent lines connected from the high side bus of each project to the corresponding generator were disabled. Note the Power Factor Analysis was performed separately for GEN-2016-022 and GEN-2016-031. The scheduled voltage for each project was set to hold the voltage at the Ranch Road 345 kV POI. That is, the scheduled voltage was set to 1.0 p.u. for the 2016 Winter Peak case, 1.0 p.u. for the 2017 Summer Peak case, and 1.0 p.u. for the 2025 Summer Peak case.

GEN-2016-024 was disabled and a generator was placed at the study project's high side voltage bus. The generator was modeled with PGEN = 55.86 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. All buses, transformers, and equivalent lines connected from the study project's high side voltage bus to GEN-2016-024 were disabled. The scheduled voltage was set to 1.0 p.u. for the 2016 Winter Peak case, 1.0 p.u. for the 2017 Summer Peak case, and 1.0 p.u. for the 2025 Summer Peak case.

GEN-2016-032 was disabled and a generator was placed at the study project's high side voltage bus. The generator was modeled with PGEN = 200 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. All buses, transformers, and equivalent lines connected from the study project's high side voltage bus to GEN-2016-032 were disabled. The scheduled voltage was set to 1.013 p.u. for the 2016 Winter Peak case, 1.015 p.u. for the 2017 Summer Peak case, and 1.013 p.u. for the 2025 Summer Peak case.

GEN-2016-048 and GEN-2015-067 were disabled in the power flow case. A generator was placed at the high side bus of GEN-2016-048 and modeled with PGEN = 82.32 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. A second generator was placed at the high side bus of GEN-2015-067 and modeled with PGEN = 150.0 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. All buses, transformers, and equivalent lines connected from the high side bus of each project to the corresponding generator was disabled. The scheduled voltage was set to 1.017 p.u. for the 2016 Winter Peak case, 1.022 p.u. for the 2017 Summer Peak case, and 1.022 p.u. for the 2025 Summer Peak case.

GEN-2016-060 was disabled and a generator was placed at the study project's high side voltage bus. The generator was modeled with PGEN = 149.5 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. All buses, transformers, and equivalent lines connected from the study project's high side voltage bus to GEN-2016-060 were disabled. The scheduled voltage was set to 1.0 p.u. for the 2016 Winter Peak case, 1.002 p.u. for the 2017 Summer Peak case, and 1.008 p.u. for the 2025 Summer Peak case.

GEN-2016-061 was disabled and a generator was placed at the study project's high side voltage bus. The generator was modeled with PGEN = 1.0 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. All buses, transformers, and equivalent lines connected from the study project's high side voltage bus to GEN-2016-061 were disabled. The scheduled voltage was set to 1.0 p.u. for the 2016 Winter Peak case, 1.0 p.u. for the 2017 Summer Peak case, and 1.001 p.u. for the 2025 Summer Peak case.

GEN-2016-068 was disabled and a generator was placed at the study project's high side voltage bus. The generator was modeled with PGEN = 200 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. All buses, transformers, and equivalent lines connected from the study project's high side voltage bus to GEN-2016-068 were disabled. The scheduled voltage was set to 1.0 p.u. for the 2016 Winter Peak case, 1.0 p.u. for the 2017 Summer Peak case, and 1.001 p.u. for the 2025 Summer Peak case.

GEN-2016-071 was disabled and a generator was placed at the study project's high side voltage bus. The generator was modeled with PGEN = 200.1 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. All buses, transformers, and equivalent lines connected from the study project's high side voltage bus to GEN-2016-071 were disabled. The scheduled voltage was set to 1.0 p.u. for the 2016 Winter Peak case, 1.004 p.u. for the 2017 Summer Peak case, and 1.003 p.u. for the 2025 Summer Peak case.

GEN-2016-072 and GEN-2013-029 were disabled in the power flow case. A generator was placed at the high side bus of GEN-2016-072 and modeled with PGEN = 300.0 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. A second generator was placed at the high side bus of GEN-2013-029 and modeled with PGEN = 299.0 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. All buses, transformers, and equivalent lines connected from the high side bus of each project to the corresponding generator was disabled. The scheduled voltage was set to 1.002 p.u. for the 2016 Winter Peak case, 1.007 p.u. for the 2017 Summer Peak case, and 1.006 p.u. for the 2025 Summer Peak case.

GEN-2016-073, GEN-2015-024, GEN-2015-025, and GEN-2015-090 were all disabled in the power flow case. A generator was placed at the high side bus of GEN-2016-073 and modeled with PGEN = 220.0 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. A second study generator

was placed at the high side bus of GEN-2015-024 and modeled with PGEN = 220.0 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. A third generator was placed at the high side bus of GEN-2015-025 and modeled with PGEN = 220.0 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. A fourth generator was placed at the high side bus of GEN-2015-090 and modeled with PGEN = 220.0 MW, Qmin = -999 Mvar, and Qmax = 999 Mvar. All buses, transformers, and equivalent lines connected from the high side bus of each project to the corresponding generator were disabled. The scheduled voltage was set to 1.0 p.u. for the 2016 Winter Peak case, 1.004 p.u. for the 2017 Summer Peak case, and 1.006 p.u. for the 2025 Summer Peak case.

5.2 Power Factor Analysis Results

The power factor was calculated for the 2016 Summer Peak, 2017 Summer Peak, and 2025 Summer Peak condition. The following tables show the power factor results for the study generators:

- Table 5-1: Power Factor Analysis for GEN-2016-009
- Table 5-2: Power Factor Analysis for GEN-2016-012
- Table 5-3: Power Factor Analysis for GEN-2016-022
- Table 5-4: Power Factor Analysis for GEN-2016-024
- Table 5-5: Power Factor Analysis for GEN-2016-031
- Table 5-6: Power Factor Analysis for GEN-2016-032
- Table 5-7: Power Factor Analysis for GEN-2016-048
- Table 5-8: Power Factor Analysis for GEN-2016-060
- Table 5-9: Power Factor Analysis for GEN-2016-061
- Table 5-10: Power Factor Analysis for GEN-2016-068
- Table 5-11: Power Factor Analysis for GEN-2016-071
- Table 5-12: Power Factor Analysis for GEN-2016-072
- Table 5-13: Power Factor Analysis for GEN-2016-073

Note that a positive Q (Mvar) output illustrates that the generator is absorbing reactive power from the system, implying a leading power factor; a negative Q (Mvar) illustrates that the generator is supplying reactive power to the system, implying a lagging power factor.

Table 5-1
Power Factor Analysis: GEN-2016-009

Reference Number	Case	16 Winter Peak			17 Summer Peak			25 Summer Peak		
		Power Factor		Q (MVAR)	Power Factor		Q (MVAR)	Power Factor		Q (MVAR)
0	Base	0.998	Lagging	-1.95	0.999	Leading	1.14	1.000	Lagging	-0.72

Study Generator GEN-2016-009

The Power Factor Analysis shows that GEN-2016-009 has a power factor range of 0.620 lagging (supplying) to 0.938 leading (absorbing) for the 2016 Winter Peak conditions, a power factor range of 0.676 lagging (supplying) to 0.929 leading (absorbing) for the 2017 Summer Peak conditions, and a power factor range of 0.800 lagging (supplying) to 0.941 leading (absorbing) for the 2025 Summer Peak conditions.

Study Generator GEN-2016-012

The Power Factor Analysis shows that GEN-2016-012 has a power factor range of 0.704 lagging (supplying) to 0.998 leading (absorbing) for the 2016 Winter Peak conditions, a power factor range of 0.963 lagging (supplying) to 0.837 leading (absorbing) for the 2017 Summer Peak conditions, and a power factor range of 0.959 lagging (supplying) to 0.837 leading (absorbing) for the 2025 Summer Peak conditions.

Study Generator GEN-2016-022

The Power Factor Analysis shows that GEN-2016-022 has a power factor range of 0.886 to 0.994 lagging (supplying) for the 2016 Winter Peak conditions, a power factor range of 0.950 lagging (supplying) to 0.999 leading (absorbing) for the 2017 Summer Peak conditions, and a power factor range of 0.959 lagging (supplying) to 0.998 leading (absorbing) for the 2025 Summer Peak conditions.

Study Generator GEN-2016-024

The Power Factor Analysis shows that GEN-2016-024 has a power factor range of 0.681 to 0.978 lagging (supplying) for the 2016 Winter Peak conditions, a power factor range of 0.858 to 0.999 lagging (supplying) for the 2017 Summer Peak conditions, and a power factor range of 0.795 to 0.985 lagging (supplying) for the 2025 Summer Peak conditions.

Study Generator GEN-2016-031

The Power Factor Analysis shows that GEN-2016-031 has a power factor range of 0.930 to 0.997 lagging (supplying) for the 2016 Winter Peak conditions, a power factor range of 0.971 lagging (supplying) to 0.999 leading (absorbing) for the 2017 Summer Peak conditions, and a power factor range of 0.976 lagging (supplying) to 0.999 leading (absorbing) to for the 2025 Summer Peak conditions.

Study Generator GEN-2016-032

The Power Factor Analysis shows that GEN-2016-032 has a power factor range of 0.957 to lagging (supplying) to 0.998 leading (absorbing) for the 2016 Winter Peak conditions, a power factor range of 0.978 lagging (supplying) to 0.999 leading (absorbing) for the 2017 Summer Peak conditions, and a power factor range of 0.957 lagging (supplying) to 0.984 leading (absorbing) for the 2025 Summer Peak conditions.

Study Generator GEN-2016-048

The Power Factor Analysis shows that GEN-2016-048 has a power factor range of 0.601 to 0.836 lagging (supplying) for the 2016 Winter Peak conditions, a power factor range of 0.644 to 0.842 lagging (supplying) for the 2017 Summer Peak conditions, and a power factor range of 0.649 to 838 lagging (supplying) for the 2025 Summer Peak conditions.

Study Generator GEN-2016-060

The Power Factor Analysis shows that GEN-2016-060 has a power factor range of 0.885 to 0.998 lagging (supplying) for the 2016 Winter Peak conditions, a power factor range of 0.973 lagging (supplying) to 0.992 leading (absorbing) for the 2017 Summer Peak conditions, and a power factor range of 0.973 lagging (supplying) to 0.999 leading (absorbing) for the 2025 Summer Peak conditions.

Study Generator GEN-2016-061

The Power Factor Analysis shows that GEN-2016-061 has a power factor range of 0.667 lagging (supplying) to 1.00 (unity) for the 2016 Winter Peak conditions, a power factor range of 0.792 lagging (supplying) to 0.987 leading (absorbing) for the 2017 Summer Peak conditions, and a power factor range of 0.8 lagging (supplying) to 0.988 leading (absorbing) for the 2025 Summer Peak conditions.

Study Generator GEN-2016-068

The Power Factor Analysis shows that GEN-2016-068 has a power factor range of 0.552 to 996 lagging (supplying) for the 2016 Winter Peak conditions, a power factor range of 0.658 lagging (supplying) to 0.985 leading (absorbing) for the 2017 Summer Peak conditions, and a power factor range of 0.803 lagging (supplying) to 0.988 leading (absorbing) for the 2025 Summer Peak conditions.

Study Generator GEN-2016-071

The Power Factor Analysis shows that GEN-2016-071 has a power factor range of 0.962 lagging (supplying) to 0.992 leading (absorbing) for the 2016 Winter Peak conditions, a power factor range of 0.991 lagging (supplying) to 0.992 leading (absorbing) for the 2017 Summer Peak conditions, and a power factor range of 0.996 leading (absorbing) to 0.995 leading (absorbing) for the 2025 Summer Peak conditions.

Study Generator GEN-2016-072

The Power Factor Analysis shows that GEN-2016-072 has a power factor range of 0.925 lagging (supplying) to 0.998 leading (absorbing) for the 2016 Winter Peak conditions, a power factor range of 0.980 lagging (supplying) to 0.997 leading (absorbing) for the 2017 Summer Peak conditions, and a power factor range of 0.989 lagging (supplying) to 0.997 leading (absorbing) for the 2025 Summer Peak conditions.

Study Generator GEN-2016-073

The Power Factor Analysis shows that GEN-2016-073 has a power factor range of 0.835 to 0.995 lagging (supplying) for the 2016 Winter Peak conditions, a power factor range of 0.978 0.999 lagging (supplying) to 1.00 (unity) for the 2017 Summer Peak conditions, and a power

factor range of 0.998 lagging (supplying) to 0.991 leading (absorbing) for the 2025 Summer Peak conditions.

SECTION 6: LOW WIND/NO WIND ANALYSIS

The objective of this task is to determine the impact of low wind or no wind conditions on all wind farms and solar farms. The 2015 Summer Peak, 2017 Summer Peak, and 2025 Summer Peak power flows provided by SPP, and corresponding updates, were examined for this analysis.

6.1 Approach

Low wind or no wind conditions were examined for all wind farms and solar farms. Generators were disabled (independently), but the collector systems remained in-service. In order to maintain generation and load balance in the SPP area, the generation was scaled after disabling the respective generator. The amount of reactive power injected into the transmission network was recorded at the respective point of interconnection. This reactive power comes from the capacitance of the project's transmission lines and collector cables. A shunt reactor was added at the high side bus to bring the Mvar flow into the POI down to approximately zero.

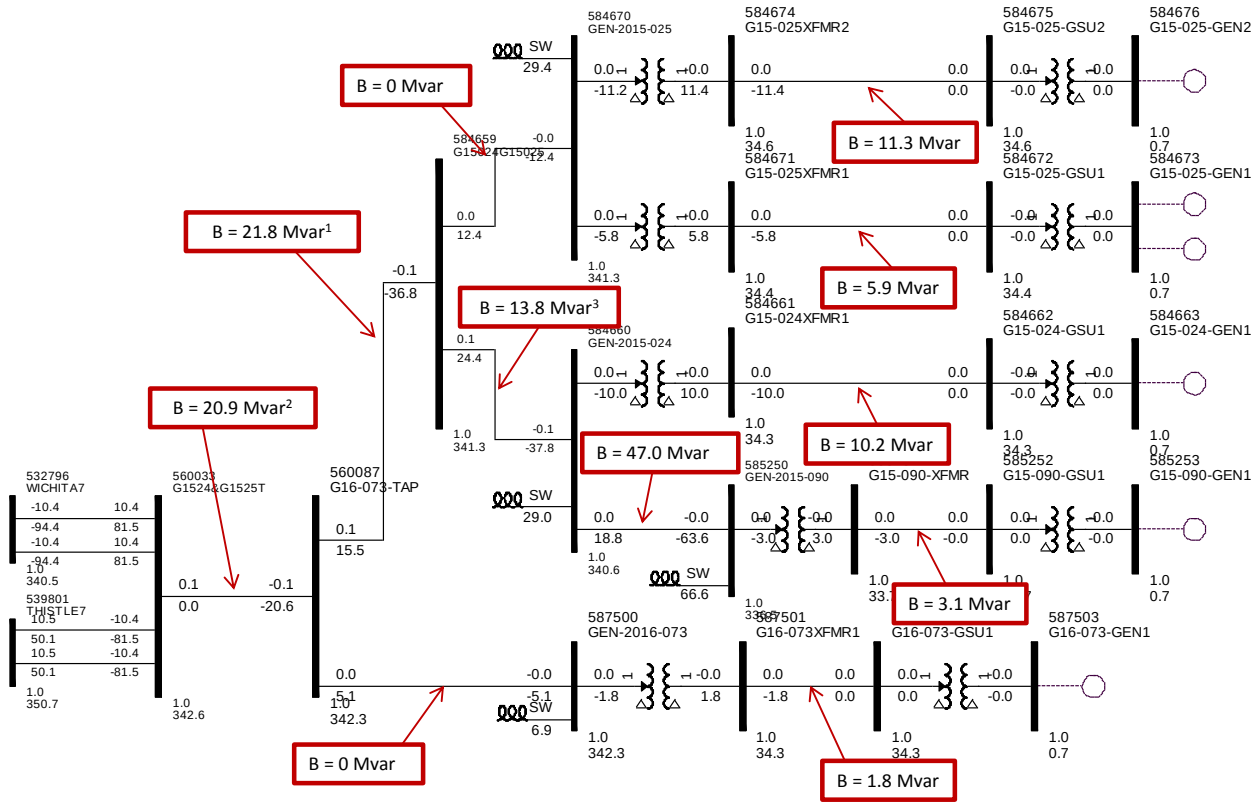
6.2 Low Wind/No Wind Analysis Results

The reactance needed to bring the Mvar flow into the point of interconnect to zero Mvar was recorded for each season. Refer to Table 6-1 for the Low Wind/No Wind Analysis results. The table lists the generators examined and the amount of reactive power needed for zero Mvar flow into the POI for each season.

Table 6-1
Low Wind/No Wind Analysis

Request	Size (MW)	Point of Interconnection	Reactor Size (Mvar)		
			16WP	17SP	25SP
GEN-2016-009	29	Osage 69 kV	0.1	0.1	0.1
GEN-2016-012	200	Tap on Waverly to LaCygne 345 kV	18.1	18.1	18.1
GEN-2016-022	151.8	Ranch Road 345 kV	9.6	9.6	9.6
GEN-2016-024	50	Midian 138 kV	0.7	0.7	0.7
GEN-2016-031	201.3	Ranch Road 345 kV	9.7	9.7	9.7
GEN-2016-032	200	Tap on Marshall to Cottonwood 138 kV	18.0	18.0	18.0
GEN-2016-048	74	Sooner 138 kV	0.8	0.8	0.8
GEN-2016-060	25.3	Belle Plain 138 kV	11.5	11.5	11.5
GEN-2016-061	250.7	Tap on Woodring to Sooner 345 kV	11.7	11.7	11.7
GEN-2016-068	250	Woodring 345 kV	34.7	34.7	34.7
GEN-2016-071	200.1	Chilocco 138 kV	9.6	9.6	9.6
GEN-2016-072	300	Renfrow 345 kV	22.4	22.4	22.4
GEN-2016-073	220	Tap on Thistle to Wichita 345 kV	7.0	7.0	7.0

Note that GEN-2016-073 shares the same POI with GEN-2015-024, GEN-2015-025, and GEN-2015-090. The reactor requirements were determined based on the shared lines from the POI to the high voltage shared buses and their individual contributions. After considering the shared lines, the reactor requirements were calculated independently from the shared high side voltage bus to the collector system for each generator. Refer to Figure 6-1 for a representation of the reactor requirements that was calculated for both current and previous study projects.



GEN-2016-073 requirements = 1.8 Mvar + 5.2 Mvar ≈ 7 Mvar

GEN-2015-024 requirements = 10.2 Mvar + 6.9 Mvar + 7.3 Mvar + 5.2 Mvar ≈ 29.6

GEN-2015-025 requirements = 11.3 Mvar + 5.9 Mvar + 7.3 Mvar + 5.2 Mvar ≈ 29.7

GEN-2015-090 requirements = 3.1 Mvar + 47.0 Mvar + 6.9 Mvar + 7.3 Mvar + 5.2 Mvar ≈ 69.5

[1]Requirement to be shared between prior projects.
[2]Requirement to be shared between prior and current projects.
[3]Requirement to be shared between GEN-2015-024 and GEN-2015-090.

Figure 6-1: Reactor Requirement calculation for GEN-2016-073.

SECTION 7: CONCLUSIONS

SUMMARY OF STABILITY ANALYSIS

The Stability Analysis determined that there were multiple contingencies that resulted in system instability, generation tripping offline, or voltage violations for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions when all generation interconnection requests were at 100% output.

The following system upgrades and adjustments are recommended:

- Addition of Wolf Creek to Neosho 345 kV line circuit #1 to improve voltage stability in the vicinity of Waverly and to mitigate tripping of project generators GEN-2016-012 and GEN-2016-024.
- Reduction of generation at GEN-2016-071 and GEN-2011-057 following prior outage of Middleton Tap to Peckham Tap 345 kV line for FLT123-PO (see Figure 3-15 for the amount of reduction in 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak) to mitigate instability and generator tripping.

SUMMARY OF THE SHORT CIRCUIT ANALYSIS

The Short Circuit Analysis was performed on the 2017 Summer Peak and 2025 Summer Peak power flow for all study projects. Refer to Table 7-1 and 7-2 for a list of maximum fault currents observed for each study project.

Table 7-1
List of Maximum Fault Currents Observed in the 2017 Summer Peak Season for Each Study Project

Study Project	Fault Current at POI (kA)	Maximum Fault Current (kA)	Fault Location	Bus Voltage (kV)
GEN-2016-009	5.66	9.98	CHIKASI2	69
GEN-2016-012	14.13	39.28	CRAIG 5	161
GEN-2016-022	14.12	43.13	NORTWST4	138
GEN-2016-024	10.11	37.71	EVANS N4	139

SUMMARY OF POWER FACTOR ANALYSIS

The Power Factor Analysis was performed on the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak power flow for all study projects. Refer to Table 7-3 for a list of the power factor ranges observed for each study project.

Table 7-3
Power Factor Ranges Observed for Each Study Project in 2016 Winter Peak, 2016 Summer Peak, and 2025 Summer Peak

Generator	Power Factor Range for each study generator[1]					
	16WP		17SP		25SP	
GEN-2016-009	-0.62	0.938	-0.676	0.929	-0.8	0.941
GEN-2016-012	-0.704	0.998	-0.963	0.837	-0.959	0.837
GEN-2016-022	-0.886	-0.994	-0.95	0.999	-0.959	0.998
GEN-2016-024	-0.681	-0.978	-0.858	-0.999	-0.795	-0.985
GEN-2016-031	-0.93	-0.997	-0.971	0.999	-0.976	0.999
GEN-2016-032	-0.957	0.998	-0.978	0.999	-0.957	0.984
GEN-2016-048	-0.601	-0.836	-0.644	-0.842	-0.649	-0.838
GEN-2016-060	-0.885	-0.998	-0.973	0.992	-0.973	0.999
GEN-2016-061	-0.667	Unity	-0.792	0.987	-0.8	0.988
GEN-2016-068	-0.552	-0.996	-0.658	0.985	-0.803	0.988
GEN-2016-071	-0.962	0.992	-0.991	0.992	-0.996	0.995
GEN-2016-072	-0.925	0.998	-0.98	0.997	-0.989	0.997
GEN-2016-073	-0.835	-0.995	-0.968	-0.999	-0.978	Unity

[1]Lagging power factors are negative and leading power factors are positive

SUMMARY OF LOW WIND/NO WIND ANALYSIS

The amount of reactive power injected into the transmission network was recorded at the point of interconnection for all study generators for each Cluster Scenario. The maximum reactance needed for zero Mvar flow was just over 34.7 Mvar for the line connecting GEN-2016-068 to the Woodring 345 kV line. The minimum reactance needed for zero Mvar flow was 0.1 Mvar for for the line connecting GEN-2016-009 to the Osage 69 kV line.

EXECUTIVE SUMMARY

SPP requested a Definitive Interconnection System Impact Study (DISIS). The DISIS required a Stability Analysis, Short-circuit Analysis, Power Factor Analysis, and Low Wind/No Wind Analysis detailing the impacts of the interconnecting projects as shown in Table ES-1.

Table ES-1
Interconnection Projects Evaluated

Request	Size (MW)	Generator Model (Gen Bus Number)	Point of Interconnection
GEN-2015-089	200	GE 2.0 MW	Utica 230 kV (652526)
GEN-2016-021	300	Vestas V110 VCSS 2.0MW (wind)	Hoskins 345kV (640226)
GEN-2016-023	150.5	GE 2.0MW and 1.79MW wind (587093, 587095)	Tap Sidney (659426) - Laramie River (659131) 345kV (560075)
GEN-2016-029	150.5	GE 2.3MW and 1.79MW wind	Tap Sidney (659426) - Laramie River (659131) 345kV (560075)
GEN-2016-034	90	GE 2.3MW wind (587223)	Tap Sidney (659426) - Laramie River (659131) 345kV (560090)
GEN-2016-043	230	GE 2.3MW wind (587283)	Hoskins 345kV (640226)
GEN-2016-050	250.7	GE 2.3MW wind (587353)	Axtell (640065)-Post Rock (530583) 345 kV (560082)
GEN-2016-055	126.5	GE 2.3MW wind (587363)	Tap Pauline (640313) -Hildreth (640222) 115 kV (560083)
GEN-2016-064	116	GE 2.0MW wind (587443)	Tap Pauline (640313) – Guide (640206) POI (Rosemont 115 kV, 560134)
GEN-2016-075	50	Vestas V110 VCSS 2.0MW wind	Tap Ft. Thompson-Hope County 345 kV (Grand Prarie, 652532)

SUMMARY OF STABILITY ANALYSIS

Cluster Scenario

The Cluster Scenario Stability Analysis determined there were multiple contingencies that resulted in voltage instability and low post-fault voltage recovery when all generation interconnection requests were at 100% output.

To mitigate the voltage instability and low post-fault steady-state voltages, the following upgrades were provided by SPP and implemented in all seasons:

- Keystone to Banner County (G16-034 Tap) 345 kV circuit #1
- SPP R Plan
    - Cherry County/Thedford 345/115/13.8 kV transformer
    - Gentleman to Cherry County 345 kV circuit #1
    - Holt County to Cherry County 345 kV circuit #1
- Rosemont to Pauline 115 kV circuit #2
- Gentleman to Keystone 345 kV circuit #2

After implementing the above upgrades, voltage instability was still observed for contingencies for all seasonal peak conditions examined. After discussion with SPP, it was determined that for the stuck breaker contingencies, the Sidney DC tie should be blocked and the shunt capacitor near Sidney 230 kV should be taken out of service. For the prior outage contingencies, a total of 350 MW of generation curtailment is necessary to mitigation violations. GEN-2016-075 (50MW) and GEN-2015-023 units 1 and 2 (each 150 MW) should be taken out of service in order to decrease the generation around Cherry County 345 kV.

After implementing these changes, the contingency analysis was re-simulated for all contingencies. With the upgrades, the Stability Analysis determined that there was no wind turbine tripping or system instability observed as a result of interconnecting all study projects at 100% output.

High GGS Sensitivity Scenario

The High GGS Scenario Stability Analysis determined there were multiple contingencies that resulted in voltage instability and low post-fault voltage recovery when all generation interconnection requests were at 100% output.

To mitigate the voltage instability and low post-fault steady-state voltages, the following upgrades were provided by SPP and implemented in all seasons:

- Keystone to Banner County (G16-034 Tap) 345 kV circuit #1
- SPP R Plan
    - Cherry County/Thedford 345/115/13.8 kV transformer
    - Gentleman to Cherry County 345 kV circuit #1
    - Holt County to Cherry County 345 kV circuit #1
- Rosemont to Pauline 115 kV circuit #2
- Gentleman to Keystone 345 kV circuit #2

After implementing the above upgrades, voltage instability was still observed for contingencies for all seasonal peak conditions examined. It was determined that for a three phase fault in the Sidney area, the shunt capacitor near Sidney 230 kV should be taken out of service. For the prior outage contingencies, a total of 350 MW of generation curtailment is necessary to mitigation violations. GEN-2016-075 (50MW) and GEN-2015-023 units 1 and 2 (each 150 MW) should be taken out of service in order to decrease the generation around Cherry County 345 kV.

The implementation of the upgrades eliminated the violations for all but one case when all generations requested were at 100% output. The case was a stuck breaker contingency in the Sidney-Ogallala area (FLT43-SB). After discussion with SPP, it was determined that additional analysis by NPPD and WAPA will be required for this contingency in the High GGS Scenario.

Stand-Alone Scenario

For GEN-2016-023, GEN-2016-029, and GEN-2016-034 voltage instability was observed for all seasonal peak conditions examined. The following mitigation was implemented to mitigate the observed violations:

- Keystone to Banner County (G16-034 Tap) 345 kV circuit #1
- SPP R Plan
    - Cherry County/Thedford 345/115/13.8 kV transformer
    - Gentleman to Cherry County 345 kV circuit #1
    - Holt County to Cherry County 345 kV circuit #1
- Gentleman to Keystone 345 kV circuit #2

For remaining stuck breaker contingencies that resulted in voltage instability, the following mitigation was implemented:

- Block Sidney 230 kV DC tie
- Take shunt capacitor near Sidney 230 kV out of service

After implementing these changes, the observed voltage instability was mitigated.

For GEN-2016-064 voltage instability was observed for all seasonal peak conditions examined. The following mitigation was implemented to mitigate the observed violations:

- Rosemont to Pauline 115 kV circuit #2

After implementing these changes, the observed voltage instability was mitigated.

For GEN-2016-075, voltage instability was observed for all seasonal peak conditions examined. The following mitigation was implemented for prior outage conditions:

- Decrease generation around Cherry County by decreasing G07170718WG generator output by 75 MW (from 200 to 125 MW) and taking GEN-2015-023 units 1 and 2 (each 150 MW) out of service

After implementing this change, the observe voltage instability was mitigated.

SUMMARY OF THE SHORT-CIRCUIT ANALYSIS

The Short-Circuit Analysis was performed on the 2017 Summer Peak and 2025 Summer Peak power flows for all study projects. Refer to Table ES-2 for a list of maximum fault currents observed for each study project for the 2017 Summer Peak case. Refer to Table ES-3 for a list of maximum fault currents observed for each study project for the 2025 Summer Peak case.

Table ES-2
List of Maximum Fault Currents Observed for Each Study Project for the 2017 Summer Peak Case

Study Project	POI Name	Fault Current at POI (kA)	Maximum Fault Current (kA)	Fault Location	Bus Voltage (kV)
GEN-2016-021	Utica 230 kV	7.90	35.07	Split Rock	115 kV
GEN-2016-021	Hoskins 345 kV	11.51	39.66	S1206	161 kV
GEN-2016-023	Tap Sidney to Laramie River (560075)	7.29	19.17	Gentleman	230 kV
GEN-2016-029	Tap Sidney to Laramie River (560075)	7.29	19.17	Gentleman	230 kV
GEN-2016-034	Tap Sidney to Laramie River (560090)	6.79	19.17	Gentleman	230 kV
GEN-2016-043	Hoskins 345 kV	11.51	39.66	S1206	161 kV
GEN-2016-050	Tap Axtell to Post Rock 345 kV	8.05	31.25	Sheldon	115 kV
GEN-2016-055	Tap Pauline to Hildreth 115 kV	8.71	31.25	Sheldon	115 kV

SUMMARY OF POWER FACTOR ANALYSIS

The upgrades identified in the Stability Analysis were implemented in the power flow cases and utilized for the Power Factor Analysis. Refer to Table ES-4 for the power factor analysis results for each study generator. The table lists the range of power factor required for each study project.

Table ES-4
Power Factor Analysis Summary for Study Projects

Study Project	Power Factor Range for Each Study Project[1]					
	16WP		17SP		25SP

[1]Lagging power factors are negative and leading power factors are positive

SUMMARY OF LOW WIND/NO WIND ANALYSIS

The amount of reactive power injected into the transmission network was recorded at the high side of the transformer near the point of interconnection for all study projects for each season. The maximum reactance needed for zero Mvar flow was -42.30 Mvar for GEN-2016-021. The minimum reactance needed for zero Mvar flow was -2.35 Mvar for GEN-2016-064.

SECTION 1: OBJECTIVES

The objective of this report is to provide Southwest Power Pool, Inc. (SPP) with the deliverables for the DISIS-2016-001 (Group 09) Definitive Impact Study. SPP requested an Interconnection System Impact Study for ten (10) generation interconnections for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak, which requires a Stability Analysis, Short-circuit Analysis, Power Factor Analysis, Low Wind/No Wind Analysis, and an Impact Study Report.

SECTION 2: BACKGROUND

The Siemens Power Technologies International PSS/E power system simulation program Version 32.2.0 was used for this study. SPP provided the stability database cases for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and a list of contingencies to be examined. The model includes the study projects shown in Table 2-1 and the previously queued projects listed in Table 2-2. Refer to Appendix A for the steady-state and dynamic model data for the study projects. A power flow one-line diagram for each generation interconnection project is shown in Figures 2-1 through 2-7. Note that the one-line diagrams represent the 2016 Winter Peak case.

The Stability Analysis determined the impacts of the new interconnecting projects on the stability and voltage recovery of the nearby system and the ability of the interconnecting projects to meet FERC Order 661A. If problems with stability or voltage recovery are identified, the need for reactive compensation or system upgrades will be investigated. Three-phase faults and single line-to-ground faults will be examined as listed in Table 2-3. Note that all contingencies listed were examined for the Cluster Scenario.

A Short-circuit Analysis was performed on the 2017 Summer Peak and 2025 Summer Peak study years for each study generator. The study was performed five buses out from the study generator's point of interconnection and results were documented.

The Power Factor Analysis determined the power factor at the high side of the transformer near the point of interconnection for the wind or solar interconnection projects for pre-contingency and post-contingency conditions. The N-1, three phase contingencies listed in Table 2-3 were used in the Power Factor analysis.

The Low Wind/No Wind Analysis was completed for all wind and solar farm interconnections. This analysis determined if reactive support is needed to have a Mvar flow of approximately zero at the point of interconnection (POI).

Table 2-1
Interconnection Projects Evaluated

Request	Size (MW)	Generator Model (Gen Bus Number)	Point of Interconnection
GEN-2015-089	200	GE 2.0 MW	Utica 230 kV (652526)

Cont. No.	Cont. Name	Description	GEN-2015-089	GEN-2016-021	GEN-2016-023	GEN-2016-029	GEN-2016-034	GEN-2016-043	GEN-2016-050	GEN-2016-055	GEN-2016-064	GEN-2016-075
34	FLT34-3PH	3 phase fault on the G16-034-Tap (560090) to G16-023-Tap (560075) 345kV line circuit 1, near G16-034-Tap. a. Apply fault at the G16-034-Tap 345kV bus. b. Clear fault after 6 cycles by tripping the faulted line.			X	X	X					
35	FLT35-3PH	3 phase fault on the G16-023-Tap (560075) to Laramie (659131) 345kV line circuit 1, near G16-023-Tap. a. Apply fault at the G16-023-Tap 345kV bus. b. Clear fault after 6 cycles by tripping the faulted line.			X	X	X					
36	FLT36-3PH	3 phase fault on the Laramie (659131) to Stegall (659135) 345kV line circuit 1, near Laramie. a. Apply fault at the Laramie 345kV bus. b. Clear fault after 6 cycles by tripping the faulted line.			X	X	X					
37	FLT37-3PH	**3 phase fault on the Sidney (659133) to Sidney2-LNX (659426) TO G16-34-TAP (560090) 345kV line circuit 1, near Sidney.** a. Apply fault at the Sidney 345kV bus. b. Clear fault after 6 cycles by tripping the faulted line.			X	X	X					
38	FLT38-3PH	**3 phase fault on the Sidney (659133) to Sidney1-LNX (659425) TO KEYSTONE (640252) 345kV line circuit 1, near Sidney.** a. Apply fault at the Sidney 345kV bus. b. Clear fault after 6 cycles by tripping the faulted line.			X	X	X					
39	FLT39-3PH	3 phase fault on the Sidney 345/230/13.8kV (659133/659210/659168) Transformer, near Sidney. a. Apply fault at the Sidney 345kV bus. b. Clear fault after 6 cycles by tripping the faulted line.			X	X	X					
40	FLT40-3PH	3 phase fault on the Ogalala 230/115/13.8kV (640302/640304/643115) Transformer circuit 1, near Ogalala 230 kV. a. Apply fault at the Ogalala 230 kV bus. b. Clear fault after 5 cycles and trip the faulted transformer.			X	X	X					
41	FLT41-3PH	3 phase fault on the Ogalala (640302) to Gentleman (640184) 230 kV line circuit 1, near Ogalala. a. Apply fault at the Ogalala 230kV bus. b. Clear fault after 5 cycles and trip the faulted line and remove fault.			X	X	X					
42	FLT42-3PH	3 phase fault on the Sidney (659134) to Sidney West (652584) 230kV line circuit 1, near Sidney. a. Apply fault at the Sidney 230 kV bus. b. Clear fault after 5 cycles, trip the faulted line, and remove the fault. c. Block the DC tie at SIDNEY 4.			X	X	X					
43	FLT43-SB	**Sidney 230 kV Stuck Breaker Scenario 1** a. Apply single phase fault at the Sidney (659134) 230kV bus. b. Wait 16 cycles and remove fault. c. Trip Sidney (659134) to Sidney Xfmr (659210) 230kV line circuit 1. d. Trip Sidney (659134) to Ogalala (640302) 230kV line circuit 1.			X	X	X					
44	FLT44-SB	**Sidney 230 kV Stuck Breaker Scenario** a. Apply single phase fault at the Sidney (659134) 230 kV bus. b. Wait 16 cycles and remove fault. c. Trip Sidney (659134) to Sidney Xfmr (659210) 230 kV line circuit 1. d. Trip Sidney (659134) 230 kV / (652572) 115 kV / (659803) 13.8 kV transformer circuit 1.			X	X	X					

Table 2-3 (Continued)
Case List with Contingency Description

Cont. No.	Cont. Name	Description	GEN-2015-089	GEN-2016-021	GEN-2016-023	GEN-2016-029	GEN-2016-034	GEN-2016-043	GEN-2016-050	GEN-2016-055	GEN-2016-064	GEN-2016-075
45	FLT45-SB	**Sidney 345 kV Stuck Breaker Scenario 1** **a. Apply single phase fault at the Sidney2-LNX (659426) 345kV bus.** b. Wait 16 cycles and remove fault. **c. Trip Sidney2-LNX (659426) to G16-034-Tap (560090) 345kV line circuit 1.** **d. Trip Sidney2-LNX3 (659426) to Sidney (659133) 345kV line circuit 1**			X	X	X					
46	FLT46-SB	**Stegall 345 kV Stuck Breaker Scenario 1** a. Apply single phase fault at the Stegall (659135) 345kV bus. b. Wait 16 cycles and remove fault. c. Trip Stegall (659135) to Laramie (659131) 345kV line circuit 1. d. Trip Stegall (659135) to Sidney (659133) 345kV line circuit 1			X	X	X					
47	FLT47-SB	**Keystone 345 kV Stuck Breaker 3310** a. Apply single phase fault at the Keystone (640252) 345kV bus on the Keystone to Sidney (659133) ckt1 345kV line. b. Run 16 cycles, remove fault. c. Trip line from Keystone (640252) to Sidney (659133) 345kV. d. Trip line from Keystone (640252) to Gentleman (640183) 345kV.			X	X	X					
48	FLT48-SB	**Keystone 345 kV Stuck Breaker 3312** a. Apply single phase fault at the Keystone (640252) 345kV bus on the Keystone to Sidney (659133) ckt1 345kV line. b. Run 16 cycles, remove fault. c. Trip line from Keystone (640252) to Sidney (659133) 345kV. d. Trip line from Keystone (640252) to Gentleman (640183) 345kV.			X	X	X					
49	FLT49-SB	**Keystone 345 kV Stuck Breaker 3304** a. Apply single phase fault at the Keystone (640252) 345kV bus on the Keystone to Gentleman (640183) ckt1 345kV line. b. Run 16 cycles, remove fault. c. Trip line from Keystone (640252) to Gentleman (640183) 345kV. d. Disconnect three winding transformer at bus 640252/640253/640254.			X	X	X					
50	FLT50-PO	**Prior outage on the Sidney (659134) – Sidney Xfmr (659210) 230 kV line circuit 1** 3 phase fault on the Sidney (659133) to Stegall (659135) 345kV line circuit 1, near Sydney. a. Apply fault at the Sidney 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 16 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.			X	X	X					
51	FLT51-PO	**Prior outage on the Sidney (659134) – Sidney Xfmr (659210) 230 kV line circuit 1** **3 phase fault on the Sidney (659133) to Sidney2-LNX (659426) TO G16-034-TAP (560090) 345kV line circuit 1, near Sydney.** a. Apply fault at the Sidney 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 16 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.			X	X	X

115	FLT115-PO	**Prior Outage of Uticajc4 230 kV (652526) to VFODNES4 230 kV (652398) CKT 1; 3 phase fault on RASMUSN4 230 kV (652536)** a. Apply fault at the RASMUSN4 (652536) 230 kV b. Clear fault after 6 cycles by tripping the faulted line.	X									
116	FLT116-PO	**Prior Outage of Uticajc4 230 kV (652526) to FTRANDL4 (652509) CKT 1; 3 phase fault on RASMUSN4 230 kV (652536)** a. Apply fault at the RASMUSN4 (652536) 230 kV b. Clear fault after 6 cycles by tripping the faulted line.	X									

SECTION 3: STABILITY ANALYSIS

The objective of the Stability Analysis was to determine the impacts of the generator interconnections on the stability and voltage recovery on the SPP transmission system. If problems with stability or voltage recovery were identified, the need for reactive compensation or system upgrades was investigated.

3.1 Approach

SPP provided MEPPI with the following three power flow cases:

- MDWG15-16WP_DIS1601_G09
- MDWG15-17SP_DIS1601_G09
- MDWG15-25SP_DIS1601_G09

Each case was examined prior to the Stability Analysis to ensure the case contained the proposed study projects and any previously queued projects listed in Tables 2-1 and 2-2 respectively. There was no suspect power flow data in the study area. The dynamic datasets were also verified and stable initial system conditions (i.e., "flat lines") were achieved. Three-phase and single phase-to-ground faults listed in Table 2-3 were examined. Single-phase fault impedances were calculated for each season to result in a voltage of approximately 60% of the pre-fault voltage. Refer to Table 3-1 for a list of the calculated single-phase fault impedances. Refer to Tables 3-2 through 3-11 for the calculated single-phase fault impedances for the Stand Alone scenarios.

Table 3-1
Calculated Single-Phase Fault Impedances for Cluster Scenario

2	FLT102-SB	-2609.4	-2406.3	-2406.3

(1) Refer to Table 2-3 for a description of the contingency scenario

Bus voltages, machine rotor angles, and previously queued generation in the study area were monitored in addition to bus voltages and machine rotor angles in the following areas:

- 640 NPPD
- 645 OPPD
- 650 LES
- 652 WAPA
- 600 XEL
- 608 MP
- 613 SMMPA
- 615 GRE

- 620 OTP
- 661 MDU

Requested and previously queued generation outside the above study area was also monitored.

The results of the analysis determined if reactive compensation or system upgrades were required to obtain acceptable system performance. If additional reactive compensation was required, the size, type, and location were determined. The proposed reactive reinforcements would ensure the wind or solar farm meets FERC Order 661A low voltage requirements and return the wind or solar farm to its pre-disturbance operating voltage. If the results indicated the need for fast responding reactive support, dynamic support such as an SVC or STATCOM was investigated. If tripping of the prior queued projects was observed during the stability analysis (for under/over voltage or under/over frequency) the simulations were re-ran with the prior queued project's voltage and frequency tripping disabled.

3.2 Cluster Scenario Stability Analysis Results

The Cluster Scenario Stability Analysis determined there were no contingencies that resulted in system instability or generation tripping offline for the examined seasonal peak conditions when all generation interconnection requests were at 100% output.

However, voltage instability and low post-fault voltage recovery were observed for all examined seasonal peak conditions. After discussion with SPP, it was determined that the following upgrades should be implemented for all seasons:

- Keystone to Banner County (G16-034 Tap) 345 kV circuit #1
- SPP R Plan
    - Cherry County/Thedford 345/115/13.8 kV transformer
    - Gentleman to Cherry County 345 kV circuit #1
    - Holt County to Cherry County 345 kV circuit #1
- Rosemont to Pauline 115 kV circuit #2
- Gentleman to Keystone 345 kV circuit #2

After implementing the above upgrades, voltage instability was still observed for contingencies FLT43-SB, FLT44-SB, FLT105-PO and FLT106-PO for all seasonal peak conditions examined. After discussion with SPP, it was determined that for the stuck breaker contingencies, FLT43-SB and FLT-44SB, the Sidney DC tie should be blocked and the shunt capacitor near Sidney 230 kV should be taken out of service. For the prior outage contingencies, FLT105-PO and FLT106-PO, 350 MW of generation curtailment was required. GEN-2016-075 (50MW) and GEN-2015-023 units 1 and 2 (each 150 MW) should be taken out of service in order to decrease the generation around Cherry County.

After implementing these changes, observed voltage violations were mitigated. Plots of the bus voltages observed for the FLT43-SB and FLT105-PO with and without mitigation are shown in Figures 3-1 through 3-6.

Refer to Table 3-12 for a summary of the Cluster Scenario Stability Analysis results for the contingencies listed in Table 2-3. Table 3-12 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria include ensuring that the transient voltage recovers to 0.7 p.u. in 2.5 seconds after the fault is cleared and ending in a steady-state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

3.3 High GGS Sensitivity Stability Analysis Results

The High GGS Sensitivity Stability Analysis determined there were no contingencies that resulted in system instability or generation tripping offline for the examined seasonal peak conditions when all generation interconnection requests were at 100% output.

However, voltage instability and low post-fault voltage recovery were observed for all examined seasonal peak conditions. After discussion with SPP, it was determined that the following upgrades should be implemented for all seasons:

- Keystone to Banner County (G16-034 Tap) 345 kV circuit #1
- SPP R Plan
    - Cherry County/Thedford 345/115/13.8 kV transformer
    - Gentleman to Cherry County 345 kV circuit #1
    - Holt County to Cherry County 345 kV circuit #1
- Rosemont to Pauline 115 kV circuit #2
- Gentleman to Keystone 345 kV circuit #2

After implementing the changes above, overvoltage was observed for FLT42-3PH. It was determined that in order to eliminate this violation, the shunt capacitor near Sidney 230 kV should be taken out of service.

As with the Cluster Scenario, for prior outage contingencies, FLT105-PO and FLT106-PO, 350 MW of generation curtailment was required. GEN-2016-075 (50MW) and GEN-2015-023 units 1 and 2 (each 150 MW) should be taken out of service in order to decrease the generation around Cherry County. After implementing these changes, observed voltage violations were mitigated.

FLT43-SB did not converge for all three seasonal peak conditions despite implementation of the recommended upgrades. After discussion with SPP, it was determined that additional analysis by NPPD and WAPA will be required for this contingency for the High GGS Sensitivity cases.

Plots of the bus voltages observed for the FLT36-3PH, FLT42-SB, and FLT49-SB with and without mitigation are shown in Figures 3-7 through 3-9.

Refer to Table 3-13 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria include ensuring that the transient voltage recovers to 0.7 p.u. in 2.5 seconds after the fault is cleared and ending in a steady-state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

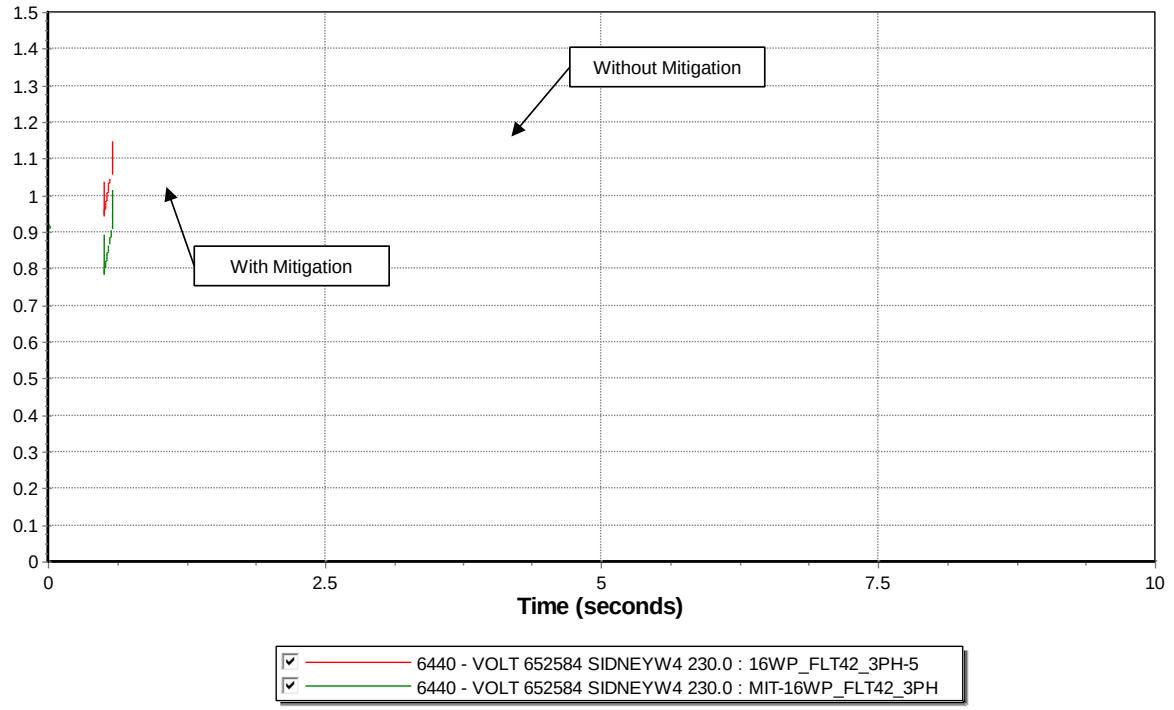

Figure 3-8. Plot of the voltage at SIDNEYW4 for FLT42-3PH for 2017 Summer Peak case with and without mitigation.

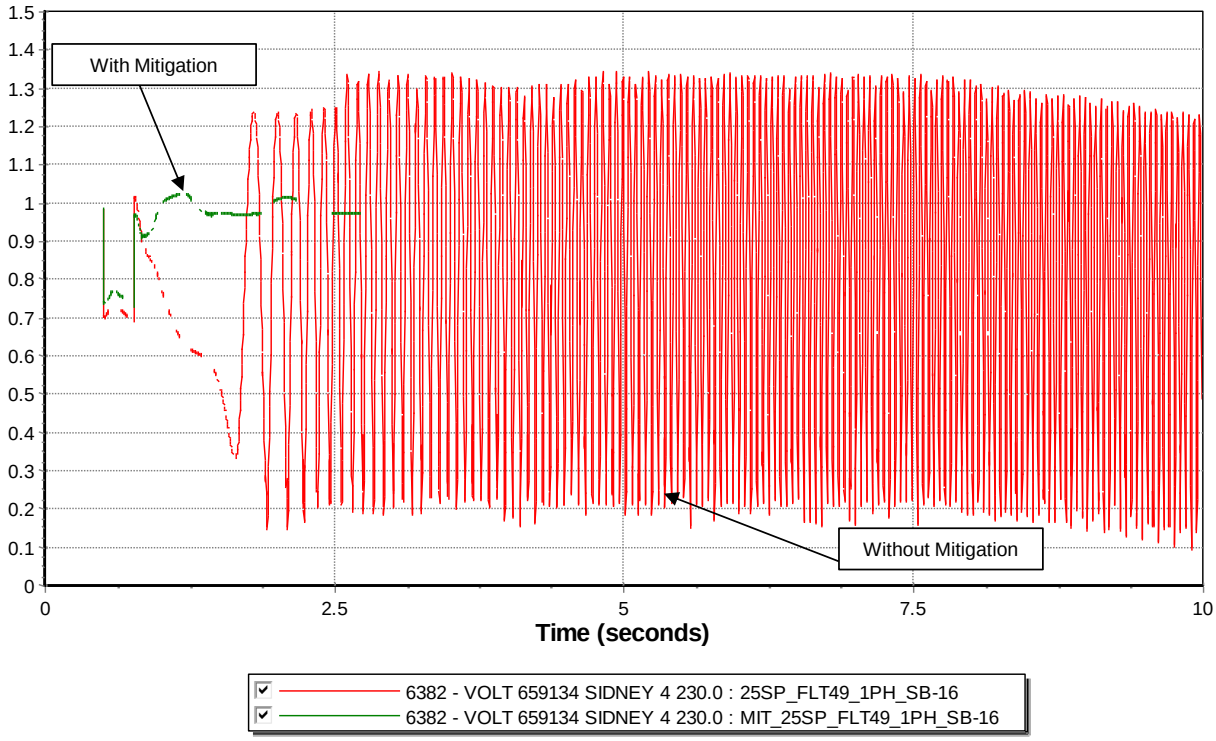

Figure 3-9. Plot of the voltage at SIDNEY 4 for FLT49-3PH for 2017 Summer Peak case with and without mitigation.

3.4 Stand Alone Scenario Stability Analysis Results: GEN-2015-089

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability or generation tripping offline for all examined seasonal peak conditions when GEN-2015-089 was interconnected at 100% output.

Refer to Table 3-14 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2015-089 Stand Alone Analysis. Table 3-14 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

Table 3-14
Stand Alone Scenario GEN-2015-089: Stability Analysis Summary of Results for 2016 Winter, 2017 Summer, and 2025 Summer Peak Conditions

(1) Refer to Tabel 2-3 for a description of the contingency scenario
(2) The highlighted cases were observed to have violations. These violations were eliminated by the mitigation recommendations provided by SPP.

3.5 Stand Alone Scenario Stability Analysis Results: GEN-2016-021

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability or generation tripping offline for all examined seasonal peak conditions when GEN-2016-021 was interconnected at 100% output.

Refer to Table 3-15 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-021 Stand Alone Analysis. Table 3-15 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

(1) Refer to Tabel 2-3 for a description of the contingency scenario
(2) The highlighted cases were observed to have violations. These violations were eliminated by the mitigation recommendations provided by SPP.

3.6 Stand Alone Scenario Stability Analysis Results: GEN-2016-023

The Stand Alone Scenario Stability Analysis determined that contingencies FLT36-3PH, FLT43-SB and FLT44-SB resulted in voltage violations for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak when GEN-2016-023 was interconnected at 100% output.

Refer to Table 3-16 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-023 Stand Alone Analysis. Table 3-16 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

To mitigate the voltage instability, the following upgrades were implemented in all seasons:

- Keystone to Banner County (G16-034 Tap) 345 kV circuit #1
- SPP R Plan
    - Cherry County/Thedford 345/115/13.8 kV Transformer
    - Gentleman to Cherry County 345 kV circuit #1
    - Holt County to Cherry County 345 kV circuit #1
- Gentleman to Keystone 345 kV circuit #2

After the above mitigation, instability was still observed for FLT43-SB and FLT44-SB. It was determined that the following mitigation was required to eliminate the violations observed for all examined seasonal peak conditions:

- Block Sidney DC tie
- Shunt Reactor near Sidney 230 kV taken out of service

After the above mitigation was implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria. Figure 3-7 and 3-8 is a plot of bus voltages for FLT36-3PH and FLT43-SB, respectively, with and without mitigation.

(1) Refer to Tabel 2-3 for a description of the contingency scenario
(2) The highlighted cases were observed to have violations. These violations were eliminated by the mitigation recommendations provided by SPP.

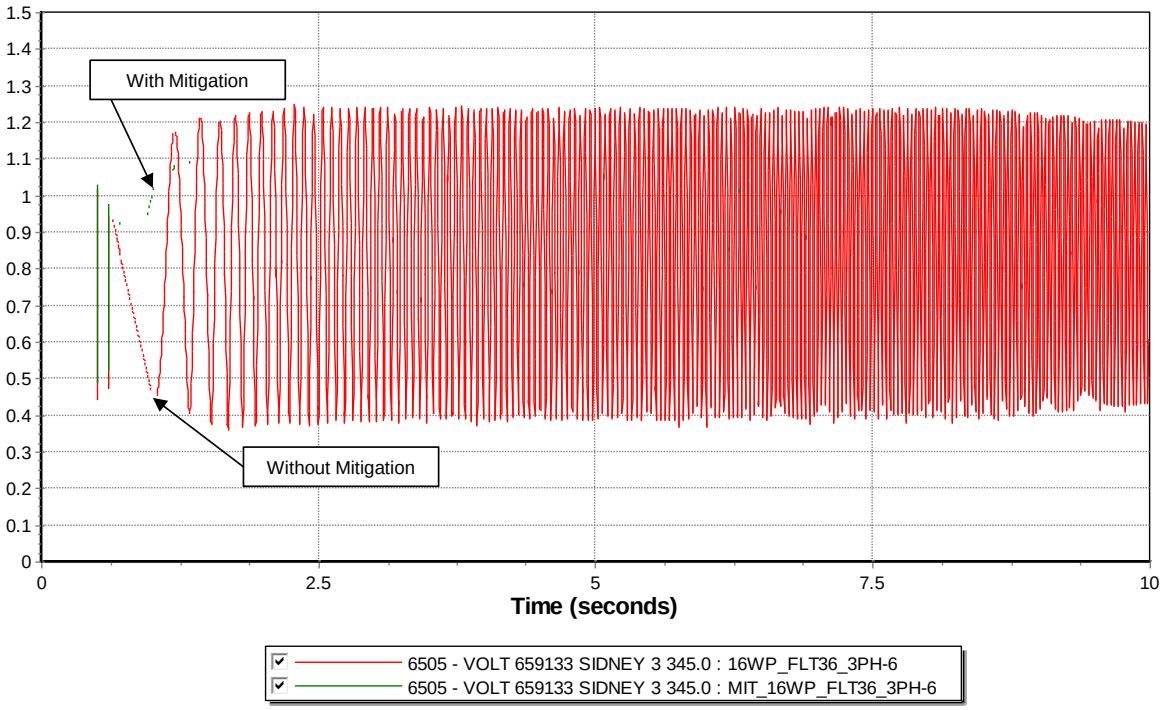

Figure 3-10. Plot of the voltage at SIDNEY for FLT36-3PH for 2016 Winter Peak case with and without mitigation.

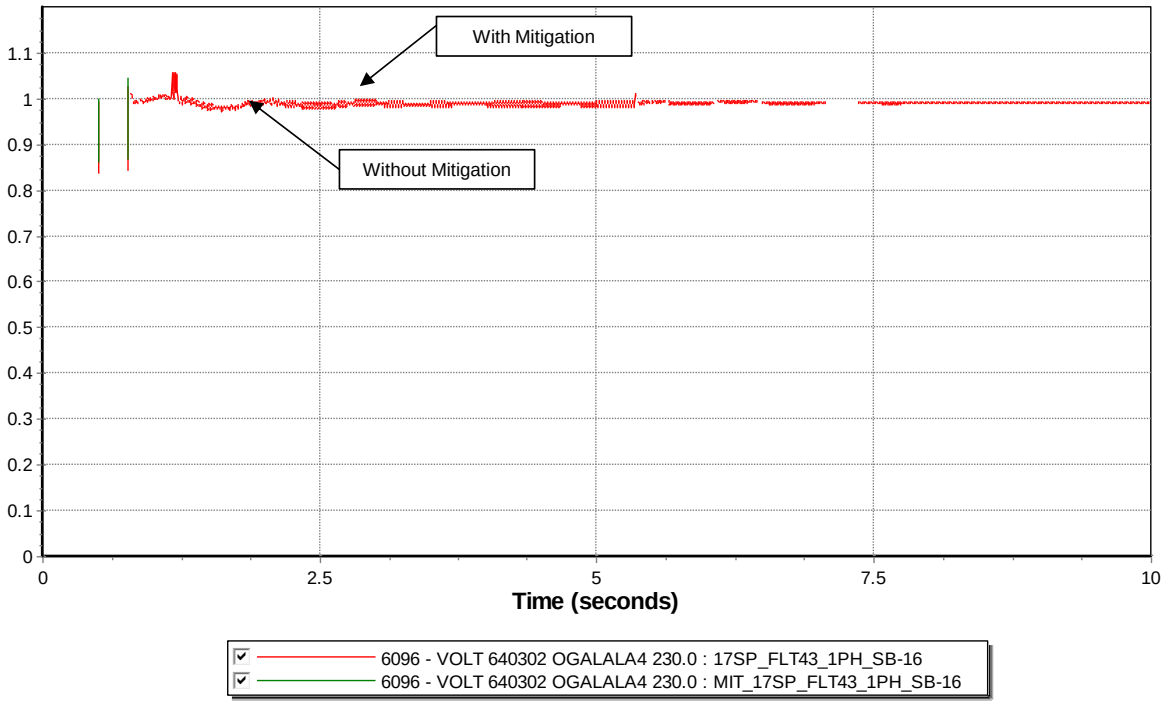

Figure 3-11. Plot of the voltage at OGALALA for FLT43-SB for 2017 Summer Peak case with and without mitigation.

3.7 Stand Alone Scenario Stability Analysis Results: GEN-2016-029

The Stand Alone Scenario Stability Analysis determined that contingencies FLT36-3PH, FLT43-SB and FLT44-SB resulted in voltage violations for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak when GEN-2016-029 was interconnected at 100% output.

Refer to Table 3-17 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-029 Stand Alone Analysis. Table 3-17 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

To mitigate the voltage instability, the following upgrades were implemented in all seasons:

- Keystone to Banner County (G16-034 Tap) 345 kV circuit #1
- SPP R Plan
    - Cherry County/Thedford 345/115/13.8 kV Transformer
    - Gentleman to Cherry County 345 kV circuit #1
    - Holt County to Cherry County 345 kV circuit #1
- Gentleman to Keystone 345 kV circuit #2

After the above mitigation, instability was still observed for FLT43-SB and FLT44-SB. It was determined that the following mitigation was required to eliminate the violations observed for all examined seasonal peak conditions:

- Block Sidney DC tie
- Shunt Reactor near Sidney 230 kV taken out of service

After the above mitigation was implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria. Figure 3-9 and 3-10 is a plot of bus voltages for FLT36-3PH and FLT43-SB, respectively, with and without mitigation.

(2) The highlighted cases were observed to have violations. These violations were eliminated by the mitigation recommendations provided by SPP.

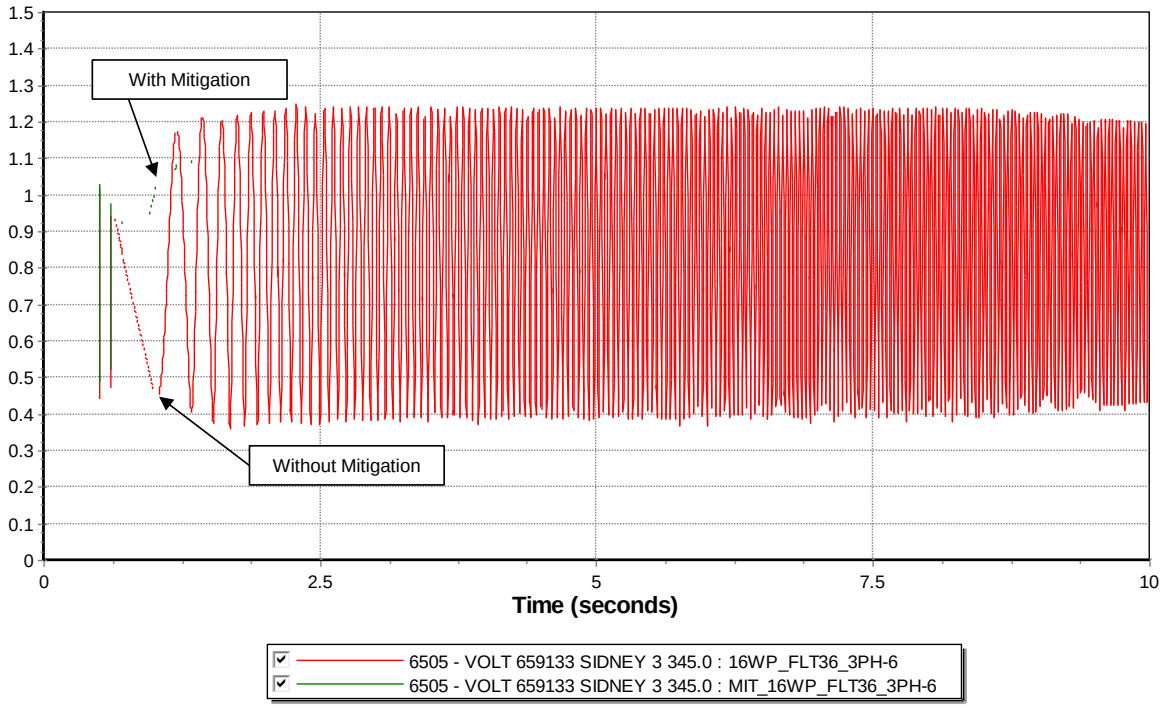

Figure 3-12. Plot of the voltage at SIDNEY for FLT36-PH for 2016 Winter Peak case with and without mitigation.

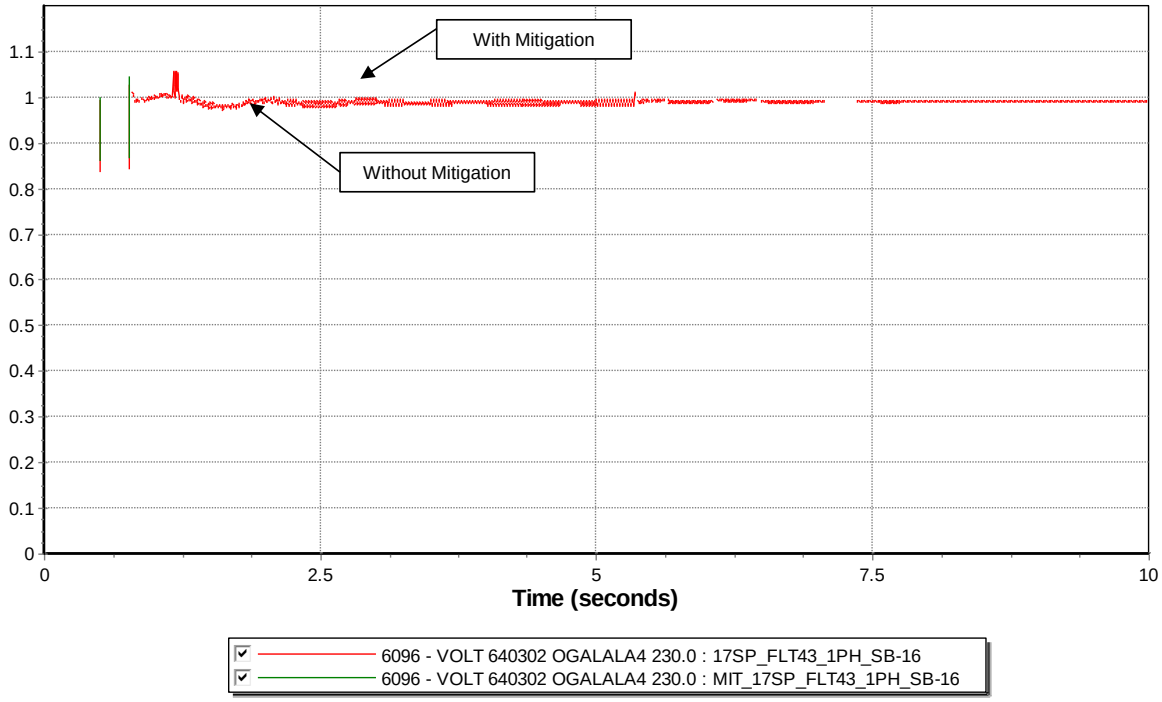

Figure 3-13. Plot of the voltage at OGALALA4 for FLT43-SB for 2017 Summer Peak case with and without mitigation.

3.8 Stand Alone Scenario Stability Analysis Results: GEN-2016-034

The Stand Alone Scenario Stability Analysis determined that contingencies FLT36-3PH, FLT43-SB and FLT44-SB resulted in voltage violations for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak when GEN-2016-034 was interconnected at 100% output.

Refer to Table 3-18 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-034 Stand Alone Analysis. Table 3-18 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

To mitigate the voltage instability, the following upgrades were implemented in all seasons:

- Keystone to Banner County (G16-034 Tap) 345 kV circuit #1
- SPP R Plan
    - Cherry County/Thedford 345/115/13.8 kV transformer
    - Gentleman to Cherry County 345 kV circuit #1
    - Holt County to Cherry County 345 kV circuit #1
- Gentleman to Keystone 345 kV circuit #2

After the above mitigation, instability was still observed for FLT43-SB and FLT44-SB. It was determined that the following mitigation was required to eliminate the violations observed for all examined seasonal peak conditions:

- Block Sidney DC tie
- Shunt Reactor near Sidney 230 kV taken out of service

After the above mitigation was implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria. Figure 3-11 and 3-12 is a plot of bus voltages for FLT36-3PH and FLT43-SB, respectively, with and without mitigation.

3.9 Stand Alone Scenario Stability Analysis Results: GEN-2016-043

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability or generation tripping offline for all examined seasonal peak conditions when GEN-2016-043 was interconnected at 100% output.

Refer to Table 3-19 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-043 Stand Alone Analysis. Table 3-19 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

(2) The highlighted cases were observed to have violations. These violations were eliminated by the mitigation recommendations provided by SPP.

3.10 Stand Alone Scenario Stability Analysis Results: GEN-2016-050

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability or generation tripping offline for all examined seasonal peak conditions when GEN-2016-050 was interconnected at 100% output.

Refer to Table 3-20 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-050 Stand Alone Analysis. Table 3-20 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

(2) The highlighted cases were observed to have violations. These violations were eliminated by the mitigation recommendations provided by SPP.

3.11 Stand Alone Scenario Stability Analysis Results: GEN-2016-055

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability or generation tripping offline for all examined seasonal peak conditions when GEN-2016-055 was interconnected at 100% output.

Refer to Table 3-21 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-055 Stand Alone Analysis. Table 3-21 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

(1) Refer to Tabel 2-3 for a description of the contingency scenario
(2) The highlighted cases were observed to have violations. These violations were eliminated by the mitigation recommendations provided by SPP.

3.12 Stand Alone Scenario Stability Analysis Results: GEN-2016-064

The Stand Alone Scenario Stability Analysis determined that contingencies FLT77-SB, FLT79-SB, FLT88-3PH and FLT91-3PO resulted in voltage violations for all examined seasonal peak conditions when GEN-2016-064 was interconnected at 100% output.

Refer to Table 3-22 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-064 Stand Alone Analysis. Table 3-22 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

To mitigate the voltage violations, the following upgrade was implemented in all seasons:

- Rosemont to Pauline 115 kV circuit #2

After the above mitigation was implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria. Figure 3-13 through 3-16 are plots of bus voltages for FLT77-SB, FLT79-SB, FLT88-3PH and FLT91-PO with and without mitigation.

Table 3-22
Stand Alone Scenario GEN-2016-064: Stability Analysis Summary of Results for 2016 Winter, 2017 Summer, and 2025 Summer Peak Conditions

3.13 Stand Alone Scenario Stability Analysis Results: GEN-2016-075

The Stand Alone Scenario Stability Analysis determined that contingencies FLT105-PO and FLT106-PO resulted in voltage instability for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak when GEN-2016-075 was interconnected at 100% output.

Refer to Table 3-23 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-075 Stand Alone Analysis. Table 3-23 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

For prior outage conditions, it was determined that the following mitigation was required to eliminate the violations observed for all examined seasonal peak conditions:

- Decrease generation around Cherry County by decreasing G07170718WG generator output by 75 MW (from 200 to 125 MW) and taking GEN-2015-023 units 1 and 2 (each 150 MW) out of service

After the above mitigation was implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria. Figure 3-17 is a plot of bus voltages for FLT105-PO with and without mitigation.

Table 3-23

(2) The highlighted cases were observed to have violations. These violations were eliminated by the mitigation recommendations provided by SPP.

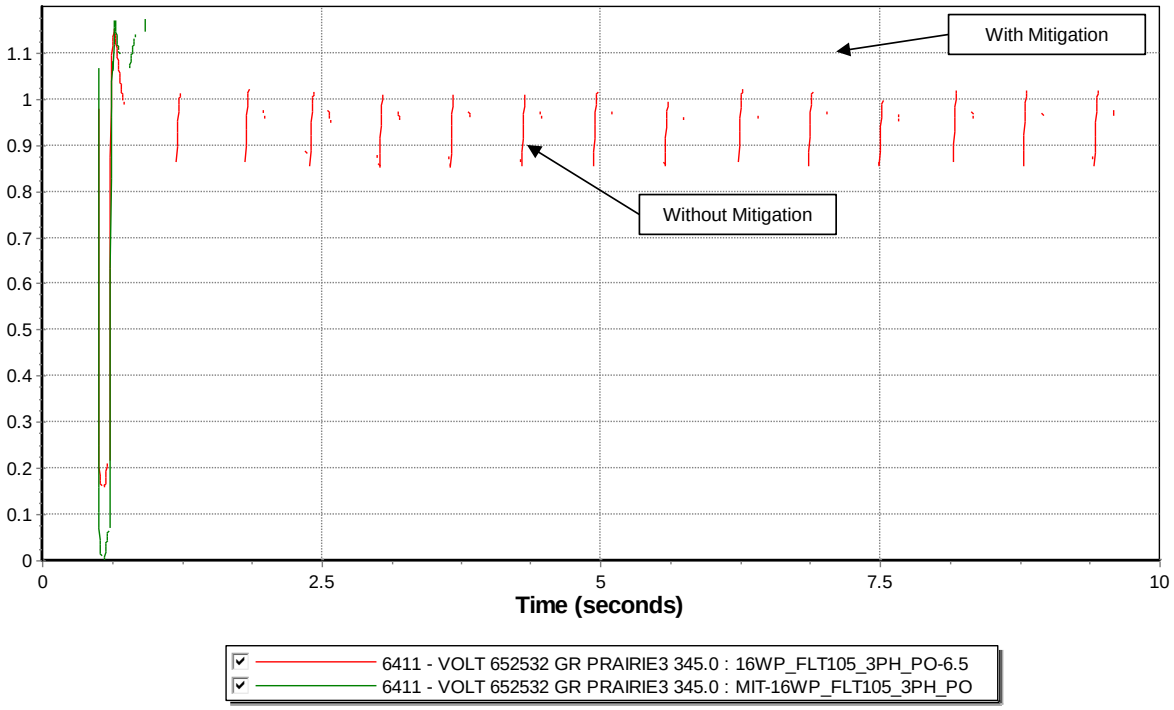

Figure 3-20. Plot of the voltage at GR PRAIRIE3 for FLT105-PO for 2016 Winter Peak Case.

SECTION 4: SHORT-CIRCUIT ANALYSIS

The objective of this task is to quantify the three-phase to ground fault currents for the 2017 and 2025 Summer Peak season for each interconnecting generator.

4.1 Approach

The Short-Circuit analysis will assess breaker adequacy and fault duties for the generator interconnection bus and five buses away from the point of interconnection. MEPPI will assume no outages to find maximum short-circuit currents that flow through the breaker. The Automatic Sequencing Fault Calculation (ASCC) function in PSS/E was utilized to perform this task. FLAT conditions were applied to pre-fault conditions and the following adjustments were utilized:

- All synchronous and asynchronous machine P and Q output was set to zero
- All transformer tap ratios were set to 1.0 p.u. and all phase shift angles were set to zero
- All generator reactance's were fixed to the subtransient reactance
- All line charging was set to zero
- All shunts were set to zero
- All loads were set to zero
- All pre-fault bus voltages were set to 1.0 p.u. and a phase shift angle of zero

4.2 Short-Circuit Results: 2017 Summer Peak

The maximum fault current for each bus is provided for the 2017 Summer Peak conditions. The following tables show the short circuit results for the study generators for the 2017 Summer Peak condition:

- Table 4-1: Short-circuit Analysis for GEN-2015-089
- Table 4-2: Short-circuit Analysis for GEN-2016-021 and GEN-2016-043
- Table 4-3: Short-circuit Analysis for GEN-2016-023 and GEN-2016-029
- Table 4-4: Short-circuit Analysis for GEN-2016-034
- Table 4-5: Short-circuit Analysis for GEN-2016-050
- Table 4-6: Short-circuit Analysis for GEN-2016-055
- Table 4-7: Short-circuit Analysis for GEN-2016-064
- Table 4-8: Short-circuit Analysis for GEN-2016-075

4.3 Short-Circuit Results: 2025 Summer Peak

The maximum fault current for each bus is provided for the 2025 Summer Peak conditions. The following tables show the short circuit results for the study generators for the 2025 Summer Peak condition:

- Table 4-9: Short-circuit Analysis for GEN-2015-089
- Table 4-10: Short-circuit Analysis for GEN-2016-021 and GEN-2016-043
- Table 4-11: Short-circuit Analysis for GEN-2016-023 and GEN-2016-029
- Table 4-12: Short-circuit Analysis for GEN-2016-034
- Table 4-13: Short-circuit Analysis for GEN-2016-050
- Table 4-14: Short-circuit Analysis for GEN-2016-055
- Table 4-15: Short-circuit Analysis for GEN-2016-064
- Table 4-16: Short-circuit Analysis for GEN-2016-075

SECTION 5: POWER FACTOR ANALYSIS

The objective of this task is to quantify the power factor at the point of interconnection for the wind farms during base case and system contingencies. SPP transmission planning practice requires interconnecting generation projects to maintain the power factor (pf) at the Point of Interconnection (POI) within +/- 0.95 pf for system intact conditions and for post-contingency conditions. This is analyzed by having the wind/solar farm maintain a prescribed voltage schedule at the point of interconnection of 1.0 p.u. voltage or higher.

The 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak power flows provided by SPP were examined prior to the Power Factor Analysis to ensure they contained the proposed study project modeled at 100% of the nameplate rating and any previously queued projects listed in Table 2-2. There was no suspect power flow data in the study area. The proposed study project and any previously queued projects at the same point of interconnection were turned off during the power factor analysis. The wind farm(s) were then replaced by a generator modeled at the high side bus with the same real power (MW) capability as the wind farm(s) and open limits for the reactive power set points (Mvar). The generator was set to hold the POI scheduled bus voltage. All N-1, three-phase fault contingencies from Table 2-3 were then applied and the reactive power required to maintain the bus voltage was recorded.

5.1 Approach

The upgrades that were identified in the Stability Analysis were implemented to each power case for the power factor analysis. Refer to Section 3 for the necessary upgrades and Table 5-1 for the scheduled voltage each study generator was set to hold at the point of interconnection for each season.

GEN-2015-089 was disabled and a generator was placed at the study project's high side bus (563230). The generator was modeled with PGEN = 200 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to GEN-2015-089 were disabled.

GEN-2016-021, GEN-2016-043, and GEN-2015-007 were all disabled in the power flow case. A generator was placed at the high side bus of GEN-2016-021 (587150) and modeled with PGEN = 300 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. A second generator was placed at the high side bus of GEN-2016-043 (587280) and was modeled with PGEN = 230 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. A third generator was placed at the high side bus of GEN-2015-007 (584510) and was modeled with PGEN = 230 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the high side bus of each project to the corresponding generator were disabled. Note the Power Factor Analysis was performed separately for GEN-2016-021 and GEN-2016-043.

GEN-2016-023 and GEN-2016-029 were disabled in the power flow case. A generator was placed at the high side bus of GEN-2016-023 (587090) and modeled with PGEN = 150.5 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. A second generator was placed at the high side bus of GEN-2016-029 (587190) and was modeled with PGEN = 150.5 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the high side bus of each project to the corresponding generator were disabled. Note the Power Factor Analysis was performed separately for GEN-2016-023 and GEN-2016-029.

GEN-2016-034 was disabled and a generator was placed at the study project's high side bus (587220). The generator was modeled with PGEN = 90 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to GEN-2016-034 were disabled.

GEN-2016-050 was disabled and a generator was placed at the study project's high side bus (587350). The generator was modeled with PGEN = 250.7 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to GEN-2016-050 were disabled.

GEN-2016-055 was disabled and a generator was placed at the study project's high side bus (560083). The generator was modeled with PGEN = 126.5 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to GEN-2016-055 were disabled.

GEN-2016-064 and GEN-2008-123 were disabled in the power flow case. A generator was placed at the high side bus of GEN-2016-064 (587440) and modeled with PGEN = 116 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. A second generator was placed at the high side bus of GEN-2008-123 (572051) and was modeled with PGEN = 89.5 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the high side bus of each project to the corresponding generator were disabled. Note the Power Factor Analysis was performed for GEN-2016-064.

GEN-2016-075, GEN-2007-017/GEN-2007-018, and Grand Prairie Generation were all disabled in the power flow case. A generator was placed at the high side bus of GEN-2016-075 (579450) and modeled with PGEN = 50 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. A second generator was placed at the high side bus of GEN-2007-017/GEN-2007-018 (579450) and was modeled with PGEN = 200 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. A third generator was placed at the high side bus of Grand Prairie Generation (579450) and was modeled with PGEN = 200 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the high side bus of each project to the corresponding generator were disabled. Note the Power Factor Analysis was performed for GEN-2016-075.

5.2 Power Factor Analysis Results

The power factor was calculated for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions. The following tables show the power factor results for the study generators:

- Table 5-1: Power Factor Analysis for GEN-2015-089
- Table 5-2: Power Factor Analysis for GEN-2016-021
- Table 5-3: Power Factor Analysis for GEN-2016-023
- Table 5-4: Power Factor Analysis for GEN-2016-029
- Table 5-5: Power Factor Analysis for GEN-2016-034
- Table 5-6: Power Factor Analysis for GEN-2016-043
- Table 5-7: Power Factor Analysis for GEN-2016-050
- Table 5-8: Power Factor Analysis for GEN-2016-055
- Table 5-9: Power Factor Analysis for GEN-2016-064
- Table 5-10: Power Factor Analysis for GEN-2016-075

Note that a positive Q (Mvar) output illustrates that the generator is absorbing reactive power from the system, implying a leading power factor; a negative Q (Mvar) illustrates that the generator is supplying reactive power to the system, implying a lagging power factor.

Table 5-1
Power Factor Analysis: GEN-2015-089

Cont. No.	Case	2016 Winter Peak			2017 Summer Peak			2025 Summer Peak

Study Generator GEN-2015-089

The Power Factor Analysis shows that GEN-2015-089 has a power factor range of 0.989 leading to unity for the 2016 Winter Peak conditions, a power factor range of 0.991 leading to unity for the 2017 Summer Peak conditions, and a power factor range of 0.991 leading to unity for the 2025 Summer Peak conditions.

Study Generator GEN-2016-043

The Power Factor Analysis shows that GEN-2016-043 has a power factor range of 0.991 leading to 0.982 lagging for the 2016 Winter Peak conditions, a power factor range of 0.992 leading to 0.976 lagging for the 2017 Summer Peak conditions, and a power factor range of 0.989 leading to 0.982 lagging for the 2025 Summer Peak conditions.

Study Generator GEN-2016-050

The Power Factor Analysis shows that GEN-2016-050 has a power factor range of 0.938 leading to 0.980 lagging for the 2016 Winter Peak conditions, a power factor range of 0.995 leading to 0.961 lagging for the 2017 Summer Peak conditions, and a power factor range of 0.952 leading to 0.958 lagging for the 2025 Summer Peak conditions.

Study Generator GEN-2016-075

The Power Factor Analysis shows that GEN-2016-075 has a power factor range of 0.974 to 0.998 lagging for the 2016 Winter Peak conditions, a power factor range of 0.979 to 0.999 lagging for the 2017 Summer Peak conditions, and a power factor range of 0.979 to 0.999 lagging for the 2025 Summer Peak conditions.

SECTION 6: LOW/NO WIND/SOLAR IRRADIANCE ANALYSIS

The objective of this task is to determine the impact of low wind or no wind conditions on wind farms that interconnect to a 345 kV or 230 kV bus. The 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak power flows provided by SPP were examined for this analysis.

6.1 Approach

Low/no wind/solar irradiance conditions were examined for all renewable energy plants. Generators were disabled (independently), but the collector systems remained in-service. In order to maintain generation and load balance in the SPP area, the generation was scaled after disabling the respective generator. The amount of reactive power injected into the transmission network was recorded at the respective point of interconnection. This reactive power comes from the capacitance of the project's transmission lines and collector cables. A shunt reactor was added at the high side bus to bring the Mvar flow into the POI down to approximately zero.

6.2 Low/No Wind/Solar Irradiance Analysis Results

The reactance needed to bring the Mvar flow into the point of interconnect to zero Mvar was recorded for each season for all wind or solar farms. Refer to Table 6-1 for the Low/No Wind/Solar Irradiance Analysis results. The table lists the generators examined and the amount of reactive power needed for zero Mvar flow into the POI for each season.

Table 6-1

SECTION 7: CONCLUSIONS

Summary of the Stability Analysis

Cluster Scenario

The Cluster Scenario Stability Analysis determined there were multiple contingencies that resulted in voltage instability and low post-fault voltage recovery when all generation interconnection requests were at 100% output.

To mitigate the voltage instability and low post-fault steady-state voltages, the following upgrades were provided by SPP and implemented in all seasons:

- Keystone to Banner County (G16-034 Tap) 345 kV circuit #1
- SPP R Plan
  - Cherry County/Thedford 345/115/13.8 kV transformer
  - Gentleman to Cherry County 345 kV circuit #1
  - Holt County to Cherry County 345 kV circuit #1
- Update of conductor data for Rosemont to Pauline 115 kV circuit #1
- Rosemont to Pauline 115 kV circuit #2
- Gentleman to Keystone 345 kV circuit #2

After implementing the above upgrades, voltage instability was still observed for contingencies for all seasonal peak conditions examined. After discussion with SPP, it was determined that for the stuck breaker contingencies, the Sidney DC tie should be blocked and the shunt capacitor near Sidney 230 kV should be taken out of service. For the prior outage contingencies, a total of 350 MW of generation curtailment is necessary to mitigation violations. GEN-2016-075 (50MW) and GEN-2015-023 units 1 and 2 (each 150 MW) should be taken out of service in order to decrease the generation around Cherry County 345 kV.

After implementing these changes, the contingency analysis was re-simulated for all contingencies. With the upgrades, the Stability Analysis determined that there was no wind turbine tripping or system instability observed as a result of interconnecting all study projects at 100% output.

High GGS Sensitivity Scenario

The High GGS Scenario Stability Analysis determined there were multiple contingencies that resulted in voltage instability and low post-fault voltage recovery when all generation interconnection requests were at 100% output.

To mitigate the voltage instability and low post-fault steady-state voltages, the following upgrades were provided by SPP and implemented in all seasons:

- Keystone to Banner County (G16-034 Tap) 345 kV circuit #1
- SPP R Plan
  - Cherry County/Thedford 345/115/13.8 kV transformer
  - Gentleman to Cherry County 345 kV circuit #1
  - Holt County to Cherry County 345 kV circuit #1
- Rosemont to Pauline 115 kV circuit #2
- Gentleman to Keystone 345 kV circuit #2

After implementing the above upgrades, voltage instability was still observed for contingencies for all seasonal peak conditions examined. It was determined that for a three phase fault in the Sidney area, the shunt capacitor near Sidney 230 kV should be taken out of service. For the prior outage contingencies, a total of 350 MW of generation curtailment is necessary to mitigation violations. GEN-2016-075 (50MW) and GEN-2015-023 units 1 and 2 (each 150 MW) should be taken out of service in order to decrease the generation around Cherry County 345 kV.

The implementation of the upgrades eliminated the violations for all but one case when all generations requested were at 100% output. The case was a stuck breaker contingency in the Sidney-Ogallala area (FLT43-SB). After discussion with SPP, it was determined that additional analysis by NPPD and WAPA will be required for this contingency in the High GGS Scenario.

Stand-Alone Scenario

For GEN-2016-023, GEN-2016-029, and GEN-2016-034 voltage instability was observed for all seasonal peak conditions examined. The following mitigation was implemented to mitigate the observed violations:

- Keystone to Banner County (G16-034 Tap) 345 kV circuit #1
- SPP R Plan
  - Cherry County/Thedford 345/115/13.8 kV transformer
  - Gentleman to Cherry County 345 kV circuit #1
  - Holt County to Cherry County 345 kV circuit #1
- Gentleman to Keystone 345 kV circuit #2

For remaining stuck breaker contingencies that resulted in voltage instability, the following mitigation was implemented:

- Block Sidney 230 kV DC tie
- Take shunt capacitor near Sidney 230 kV out of service

After implementing these changes, the observed voltage instability was mitigated.

For GEN-2016-064 voltage instability was observed for all seasonal peak conditions examined. The following mitigation was implemented to mitigate the observed violations:

- Rosemont to Pauline 115 kV circuit #2

After implementing these changes, the observed voltage instability was mitigated.

For GEN-2016-075, voltage instability was observed for all seasonal peak conditions examined. The following mitigation was implemented for prior outage conditions:

- Decrease generation around Cherry County by decreasing G07170718WG generator output by 75 MW (from 200 to 125 MW) and taking GEN-2015-023 units 1 and 2 (each 150 MW) out of service

After implementing this change, the observe voltage instability was mitigated.

Summary of the Short-Circuit Analysis

The Short-Circuit Analysis was performed on the 2017 Summer Peak and 2025 Summer Peak power flows for all study projects. Refer to Table 7-1 for a list of maximum fault currents observed for each study project for the 2017 Summer Peak case. Refer to Table 7-2 for a list of maximum fault currents observed for each study project for the 2025 Summer Peak case.

Table 7-1
List of Maximum Fault Currents Observed for Each Study Project for the 2017 Summer Peak Case

Study Project	POI Name	Fault Current at POI (kA)	Maximum Fault Current (kA)	Fault Location	Bus Voltage (kV)

1. Executive Summary

The DISIS-2016-001 (Group 12) Impact Study is a generation interconnection study performed by POWER-tek Global Inc. for Southwest Power Pool (SPP). This report presents the results of impact study comprising of power factor, short circuit, and stability analyses for both cluster and stand-alone scenarios of the proposed interconnection projects under DISIS-2016-001 (Group 12) ("The Projects") as described in Table 1.1 below:

Table 1.1: Interconnection Request

Request	Size (MW)	Generator Model	Point of Interconnection (POI)
GEN-2016-013	10MW uprate (total = 60MW winter/52MW summer)	GENROU combustion turbine	La Russell 161kV (547479)
GEN-2016-014	10MW uprate (total = 60MW winter/52MW summer)	GENROU combustion turbine	La Russell 161kV (547479)

Power factor analysis, short circuit analysis up to 5 Buses away from each point of interconnection (POI), and transient stability simulations were performed for the Projects in service at its full output. SPP provided three base cases for Winter-2016, Summer-2017, and Summer-2025, each comprising of a power flow, sequence data and corresponding dynamics database. The previous queued request projects were already modeled in the base cases.

The power factor analysis consists of running all three phase contingencies shown in the Fault Definitions table in power flow to advise the necessary power factor at the POI for each contingency.

The power factor analysis indicates that interconnection request i.e., La Russell 161kV (547479) are required to provide reactive power as indicated in Tables 3.2.2 through 3.2.4. During power factor analysis, it is observed that 3 phase contingencies are meeting convergence criteria. However, it is important to highlight here that N-2 outages i.e., Pre Outage cases at the POI (La Russell 161kV) results in significant overloading at the remaining 3rd live circuit. These prior outage conditions determined a need for curtailment of studied generation in the case of certain transmission outages.

Per the SPP OATT, the Interconnection Customer will be required to provide 95% lagging (supplying vars) and 95% leading (absorbing vars) at the POI.

During stability performance for both cluster and stand-alone scenarios, all the 3 phase contingencies that involved the point of interconnection i.e., La Russell 161kV (547479) the response of the system is unstable especially during winter-2016 scenario. In this regard, further simulations were made to test such contingencies by considering the re-closer at the remote end (not at the POI end) and even with extended fault durations. It is observed that the response of the system remains stable with considering re-closer at the remote ends only i.e., (reference to plots for contingencies FLT01A-3PH, FLT03A-3PH, FLT05A-3PH, FLT31A-3PH, and FLT32A-3PH). Therefore it is recommended that for the contingencies that involved the POI, the re-closer should be considered at the remote end only and should not be considered at the POI side.

2. Introduction

2.1. Project Overview and Assumptions

The DISIS-2016-001 (Group 12) Impact Study is a generation interconnection study performed by POWER-tek Global Inc. for SPP. This report presents the results of impact study comprising of power factor, short circuit analysis, and stability analyses for both cluster and stand-alone scenarios of the proposed interconnection projects under DISIS-2016-001 (Group 12) ("The Projects") as described in Table 2.1.1 below:

Table 2.1.1: Interconnection requests

Request	Size (MW)	Generator Model	Point of Interconnection (POI)
GEN-2016-013	10MW uprate (total = 60MW winter/52MW summer)	GENROU combustion turbine	La Russell 161kV (547479)
GEN-2016-014	10MW uprate (total = 60MW winter/52MW summer)	GENROU combustion turbine	La Russell 161kV (547479)

Figure 2.1.1 show the single line diagram for the interconnection of the Projects to present and planned system of SPP. This arrangement was modeled and studied in power flow cases for these projects.

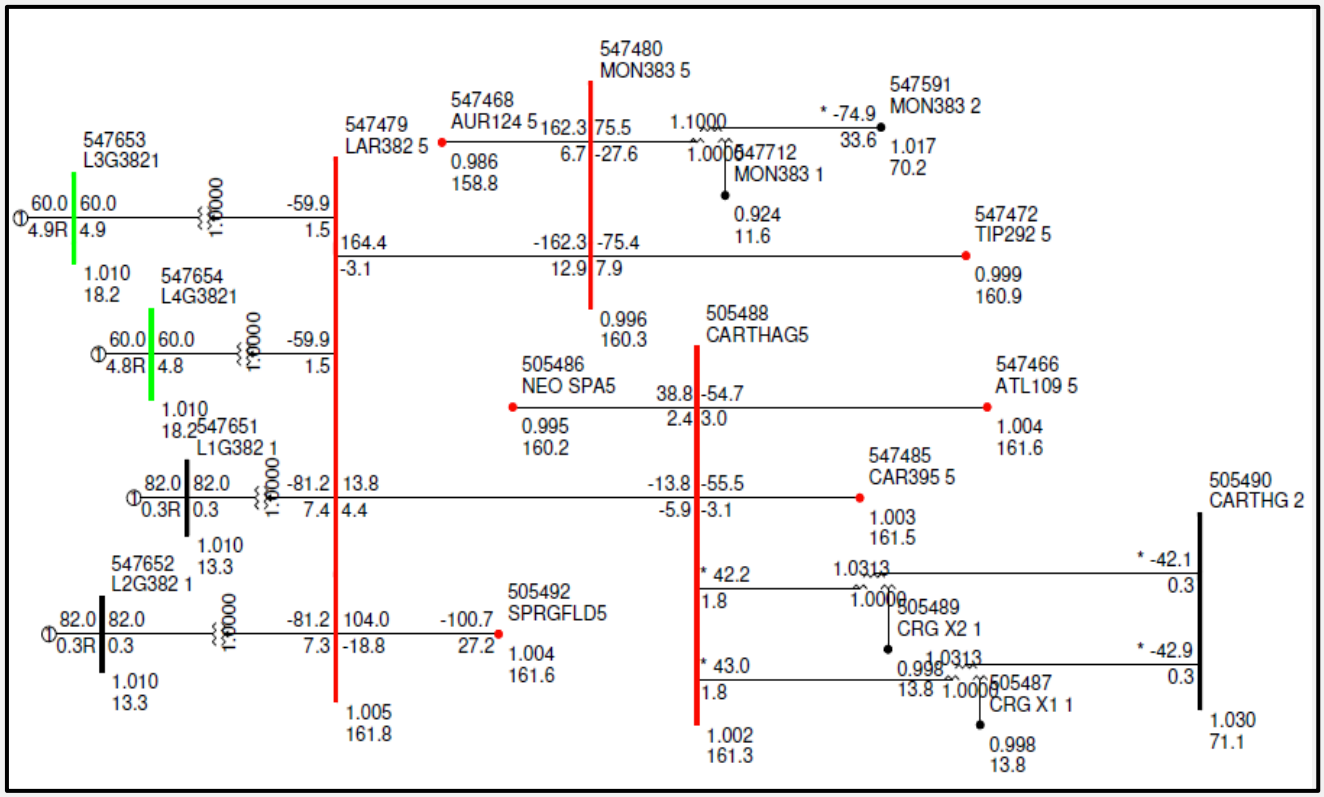

Figure 2.1.1: Power flow single line diagram for GEN-2016-013, GEN-2016-014 and surrounding system components

Appendix-D contains the machines, interconnection, and machines user model parameters.

Table 2.1.2 below shows the list of prior queued projects modeled in the base case.

Table 2.1.2: List of previous queued request projects

Request	Size (MW)	Wind Turbine Model	Point of Interconnection
GEN-2013-011	30.0 Increase (Pmax=683.0)	GENROU (509416)	Turk 138kV (507454)

ATC (Available Transfer Capability) studies were not performed as part of this study. These studies will be required at the time transmission service is actually requested. Additional transmission upgrades may be required based on that analysis.

Study assumptions in general have been based on the specific information and data provided by SPP. The accuracy of the conclusions contained within this study is dependent on the assumptions made with respect to other generation additions and transmission improvements planned by other entities. Changes in the assumptions of the timing of other generation additions or transmission improvements may affect this study's conclusions.

2.2. Objectives

The objectives of the study are to conduct power factor analysis and to determine the impact on system stability of interconnecting the proposed power plants to SPP's transmission system.

2.3. Models and Simulations Tools Used

Version 32.2.0 of the Siemens, PSS/E™ power system simulation program was used in this study.

SPP provided its latest stability database cases for Winter-2016, Summer-2017, and Summer-2025 peak seasons. The Project's PSS/E model had been developed prior to this study and was included in the power flow case and the dynamics database. Machines, interconnection and dynamic model data for the Project plants is provided in Appendix D.

Power flow single line diagram of the projects in summer 2017 peak condition is shown in Figure 2.1.1. This figure shows that combustion turbine model includes representation of the radial transmission line, the substation transformer from transmission voltage (161kV) to 18.0kV. The remainder of each power plant is represented by lumped equivalents including a generator, a step-up transformer, and collector system impedance.

No special modeling is required of line relays in these cases, except for the special modeling related to the wind-turbine tripping.

All generators in Areas 502, 520, 523, 524, 525, 351 were monitored.

3. Power Factor Analysis

3.1. Methodology

Power factor analysis was conducted for the Project using the following methodology:

1. Replace the power plant by a generator at the high side bus 345 kV, 138 kV, 115kV, or 69 kV bus, as applicable, with the MW of the power plants at that point of interconnection.
2. Turn off the power plant as modeled (as well as previous queued projects at the same point of interconnection).
3. Model a var generator at the Project's high voltage side, 345 kV, 138 kV, 115kV, or 69kV bus, as applicable. The var generator is set to hold a voltage schedule at the POI consistent with the voltage schedule in the provided power flow cases for summer and winter or 1.0 pu voltage, whichever is higher.
4. Perform the steady state contingency analysis to determine the power factor necessary at the POI for each contingency.
5. If the required power factor at the POI is beyond the capability of the studied wind turbines to meet (at the POI) capacitor banks may be considered for the stability analysis. The preference is to locate the capacitance banks on the 34.5 kV customer side. Factors to sizing capacitor banks include:
    5.1. The ability of the power plant to meet FERC Order 661A (low voltage ride through) with and without capacitor banks.
    5.2. The ability of the power plant to meet FERC Order 661A (power plant recovery to pre-fault voltage).
    5.3. If power plants trips on high voltage, power factor lower than unity may be required.

3.2. Analysis

Analysis was performed for the proposed Projects with all prior queued projects in service. A var generator was modeled at the point of interconnection and was set to hold a voltage schedule at the POI consistent with the voltage schedule in the provided power flow cases or 1 p.u. whichever is higher. The voltages for these Projects are summarized in Table 3.2.1. All upgrades and instructions were made in the base cases. No other changes were made in the base cases provided, other than the addition of the var generators. Contingency analysis was run for provided list of contingencies.

Table 3.2.1: POI voltages for the summer and winter peak cases

Request	Point of Interconnection	Size (MW)	Base Case Voltage (p.u.)		
			Winter 2016 Peak	Summer 2017 Peak	Summer 2025 Peak
GEN-2016-013	La Russell 161kV (547479)	10MW uprate (total = 60MW winter/52MW summer)	1.004	1.0	1.0
GEN-2016-014	La Russell 161kV (547479)	10MW uprate (total = 60MW winter/52MW summer)	1.002	1.0	1.0

The details of the var requirement during contingencies are highlighted in Table 3.2.2, 3.2.3 and 3.2.4. The highest and the lowest values obtained are highlighted in these tables.

1. For 2016 winter case: The maximum var generator supply is -8.9 MVARs at 1.0 (leading power factor) for the outage of 547480 [MON383 5 161.0] TO BUS 547472 [TIP292 5 161.0] CKT outage. The minimum var requirement is -38.1 MVAR at 1.0 (leading power factor) for outage of 547480 [MON383 5 161.0] TO BUS 547468 [AUR124 5 161.0] CKT outage.

3.3. Conclusions

The power factor analysis indicates the DISIS-2016-001 (Group 12) interconnection requests i.e., GEN-2016-013, and GEN-2016-014 are required to maintain the SPP standard power factor at the point of interconnection i.e., La Russell 161kV (547479) based on the contingencies studied.

All 3 phase contingencies for power factor analysis are meeting convergence criteria. However, it is important to highlight here that N-2 outages i.e., Pre Outage cases at the POI (La Russell 161kV) results in significant overloading at the remaining 3rd live circuit. These prior outage conditions determined a need for curtailment of studied generation in the case of certain transmission outages.

Per the SPP OATT, the Interconnection Customer will be required to provide 95% lagging (supplying vars) and 95% leading (absorbing vars) at the POI.

4. Short Circuit Analysis

The short circuit analysis out five buses away was performed for 2017, and 2025 summer peak case for each interconnection request under project cluster scenario of DISIS-2016-001 (Group 12). No outage was assumed in the system model.

4.1. Short Circuit Result for 2017 Summer Peak Case

The short circuit results for summer-2017 scenario (assumed not outage) at the POI are tabulated below.

4.1.1. Short Circuit Result for La Russell 161kV (547479)

The results of the short circuit analysis for POI i.e., La Russell 161kV (547479) and five bus levels away are tabulated below in table 4.1.1.

Table 4.1.1: Short circuit results for La Russell 161kV (547479)

4.2. Short Circuit Result for 2025 Summer Peak Case

The short circuit results for summer-2025 scenario (assumed not outage) at the POI are tabulated below.

4.2.1. Short Circuit Result for La Russell 161kV (547479)

The results of the short circuit analysis for POI i.e., La Russell 161kV (547479) and five bus levels away are tabulated below in table 4.2.1.

Table 4.2.1: Short circuit results for La Russell 161kV (547479)

5. Stability Analysis for Cluster Scenario

5.1. Faults Simulated

Thirty One (31) faults were considered for the transient stability simulations which included three phase faults, as well as single phase line faults. Single-phase line faults were simulated by applying fault impedance to the positive sequence network at the fault location. As per the SPP current practice to compute the fault levels, the fault impedance was computed to give a positive sequence voltage at the specified fault location of approximately 60% of pre-fault voltage.

Concurrently and previously queued projects as respectively shown in Table-1 and Table-2 of the study request i.e., GEN-2013-011 as well as areas number 502, 520, 523, 524, 525, and 351 were monitored during all the simulations. Table 5.1.1 shows the list of simulated contingencies. This table also shows the fault clearing time and the time delay before re-closing for all the study contingencies.

Simulations were performed with a 0.1-second steady-state run followed by the appropriate disturbance as described in Table 5.1.1. Simulations were run for minimum 15-second duration to confirm proper machine damping.

Some additional contingencies were also performed without re-closer at the point of interconnection i.e., La Russell 161kV (547479) to verify that all unstable contingencies in table 5.1.1 becomes stable without considering the re-closer at the POI i.e., (the contingencies that involved POI, the re-closer is considered at the remote end but not considered at the POI side). Table 5.1.2 shows the list of simulated contingencies. This table also shows the fault clearing time and the time delay before re-closing for all the study contingencies.

Table 5.1.1 and 5.1.2 summarizes the overall results for all faults simulations of cluster scenario. Complete sets of plots for Winter-2016, Summer-2017, and Summer-2025 peak seasons for each fault are included in Appendices A, B and C respectively.

Table 5.1.1: List of simulated faults for cluster scenario stability analysis

Cont. #	Contingency Name	Description	2016 winter Results	2017 summer Results	2025 Summer Results
1	FLT01-3PH	3 phase fault on the LAR382 5 (547479) to MON383 5 (547480) 161kV line, near LAR382 5. a. Apply fault at the LAR382 5 161kV bus. b. Clear fault after 5 cycles by tripping the faulted line c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. 5.2. Simulation Results for Cluster Scenario

For cluster scenarios, all the 3 phase contingencies that involved the Point of interconnection i.e., La Russell 161kV (547479) the response of the system is unstable especially during winter-2016 scenario. In this regard, further simulations were made to test such contingencies by considering the re-closer at the remote end (not at the POI end) and even with extended fault durations. It is observed that the response of the system remains stable with considering re-closer at the remote ends only i.e., (reference to plots for contingencies FLT01A-3PH, FLT03A-3PH, FLT05A-3PH, FLT31A-3PH, and FLT32A-3PH). Therefore we recommend for the contingencies that involved the POI the re-closer should be considered at the remote end only and should not be considered at the POI side.
For all other contingencies, there are no impacts on the stability performance of the SPP system for the contingencies tested on the SPP provided base cases.

6. Stability Analysis for Stand-Alone Scenarios

For stand-alone scenario, selective contingencies are simulated for each interconnection request at 100% capacity of each generator at the POI.

6.1. Fault Simulated for GEN-2016-013 Request

Table 6.1.1, summarizes the results for all simulations for GEN-2016-013 request. Some additional contingencies were also performed without re-closer at the point of interconnection i.e., La Russell 161kV (547479) to verify that all unstable contingencies in table 6.1.1 becomes stable without considering the re-closer at the POI.

Table 6.1.1 and 6.1.2 summarizes the overall results for all faults simulations of stand-alone scenario. Complete sets of plots for Winter-2016, Summer-2017, and summer-2025 peak seasons for each fault for GEN-2016-013 are in Appendices E1, E2, and E3 respectively.

Table 6.1.1: List of simulated faults for stand-alone stability analysis (GEN-2016-013)

6.2. Fault Simulated for GEN-2016-014 Request

Table 6.2.1, summarizes the results for all simulations for GEN-2016-014 request. Some additional contingencies were also performed without re-closer at the point of interconnection i.e., La Russell 161kV (547479) to verify that all unstable contingencies in table 6.2.1 becomes stable without considering the re-closer at the POI.

Table 6.2.1 and 6.2.2 summarizes the overall results for all faults simulations of stand-alone scenario. Complete sets of plots for Winter-2016, Summer-2017, and summer-2025 peak seasons for each fault for GEN-2016-014 are in Appendices F1, F2, and F3 respectively.

Table 6.2.1: List of simulated faults for stand-alone stability analysis (GEN-2016-014)

6.3. Simulation Results for Stand-Alone Scenarios

For stand-alone scenarios, all the 3 phase contingencies that involved the point of interconnection i.e., La Russell 161kV (547479) the response of the system is unstable especially during winter-2016 scenario. In this regard, further simulations were made to test such contingencies by considering the re-closer at the remote end (not at the POI end) and even with extended fault durations. It is observed that the response of the system remains stable with considering re-closer at the remote ends only i.e., (reference to plots for contingencies FLT01A-3PH, FLT03A-3PH, FLT05A-3PH, FLT31A-3PH, and FLT32A-3PH). Therefore we recommend for the contingencies that involved the POI the re-closer should be considered at the remote end only and should not be considered at the POI side.

For all other contingencies, there are no impacts on the stability performance for stand-alone scenarios of the SPP system for the contingencies tested on the SPP provided base cases.

7. Conclusions

The findings of the impact study for the proposed interconnection projects under DSIS-2015-002 (Group 12) considered 100% of their proposed installed capacity is as follows:

1. The power factor analysis indicates that interconnection request i.e., La Russell 161kV (547479) are required to provide reactive power as indicated in Tables 3.2.2 through 3.2.4. During power factor analysis, it is observed that 3 phase contingencies are meeting convergence criteria. However, it is important to highlight here that N-2 outages i.e., Pre Outage cases at the POI (La Russell 161kV) results in significant overloading at the remaining 3rd live circuit. These prior outage conditions determined a need for curtailment of studied generation in the case of certain transmission outages.
   Per the SPP OATT, the Interconnection Customer will be required to provide 95% lagging (supplying vars) and 95% leading (absorbing vars) at the POI.

2. During stability performance for both cluster and stand-alone scenarios, all the 3 phase contingencies that involved the point of interconnection i.e., La Russell 161kV (547479) the response of the system is unstable especially during winter-2016 scenario. In this regard, further simulations were made to test such contingencies by considering the re-closer at the remote end (not at the POI end) and even with extended fault durations. It is observed that the response of the system remains stable with considering re-closer at the remote ends only i.e., (reference to plots for contingencies FLT01A-3PH, FLT03A-3PH, FLT05A-3PH, FLT31A-3PH, and FLT32A-3PH). Therefore it is recommended that for the contingencies that involved the POI the re-closer should be considered at the remote end only and should not be considered at the POI side.

1. Executive Summary

The DISIS-2016-001 (Group 13) Impact Study is a generation interconnection study performed by POWER-tek Global Inc. for Southwest Power Pool (SPP). This report presents the results of impact study comprising of power factor, short circuit, and stability analyses for cluster scenarios of the proposed interconnection projects under DISIS-2016-001 (Group 13) ("The Projects") as described in Table 1.1 below:

Table 1.1: Interconnection Request

Request	Size (MW)	Generator Model	Point of Interconnection (POI)
GEN-2016-040	18.4 uprate to GEN-2015-005 (total 218.5MW)	GE 2.3MW & 1.79MW	Nebraska City-Sibley 345kV, (G15051640TAP, 560028)
ASGI-2016-003	12	GENROU	Paola 161kV (543069)

Power factor analysis, short circuit analysis up to 5 Buses away from the point of interconnection (POI), and transient stability simulations were performed for the Projects in service at its full output. SPP provided three base cases for Winter-2016, Summer-2017, and Summer-2025, each comprising of a power flow, sequence data and corresponding dynamics database. The previous queued request projects were already modeled in the base cases.
The power factor analysis consists of running all N-1, three phase contingencies shown in the Fault Definitions table in power flow to advise the necessary power factor at the POI for each contingency.

The power factor analysis indicates that interconnection requests i.e., Nebraska City-Sibley 345kV (G15051640TAP, 560028), and Paola 161kV (543069) are required to provide reactive power as indicated in Tables 3.2.2 through 3.2.4. Per the SPP OATT, the Interconnection Customer will be required to provide 95% lagging (supplying vars) and 95% leading (absorbing vars) at the POI.

To offset the capacitive effects of the collector system and transmission line of the wind farm under low wind or no wind conditions, the inductive reactive support analysis for wind generator GEN-2016-040 performed for Summer-2017 scenario. This analysis indicates that at POI Nebraska City-Sibley 345kV (G15051640TAP, 560028) 9.1 MVAR reactor is required at Bus 584490 to maintain zero MVAR flow at POI. Maintaining zero MVARs flow at the POI at all times is not possible with static reactor banks. It will be determined on a case by case basis for each generator as to whether additional reactor banks are required for low wind conditions.

There are no impacts on the stability performance of the SPP system during both cluster and stand-alone scenarios for the contingencies tested on the provided base cases. The study machines stayed on-line and stable for all simulated faults. The project stability simulations with thirty six (36) specified test disturbances did not show instability problems in the SPP system. Any oscillations were damped out.

2. Introduction

2.1. Project Overview and Assumptions

The DISIS-2016-001 (Group 13) Impact Study is a generation interconnection study performed by POWER-tek Global Inc. for SPP. This report presents the results of impact study comprising of power factor, short circuit analysis, and stability analyses for both cluster and stand-alone scenarios of the proposed interconnection projects under DISIS-2016-001 (Group 13) ("The Projects") as described in Table 2.1.1 below:

Table 2.1.1: Interconnection requests

Request	Size (MW)	Wind Turbine Model	Point of Interconnection
GEN-2016-040	18.4 uprate to GEN-2015-005 (total 218.5MW)	GE 2.3MW & 1.79MW	Nebraska City-Sibley 345kV, (G15051640TAP, 560028)
ASGI-2016-003	12	GENROU	Paola 161kV (543069)

Figure 2.1.1, and Figure 2.1.2 respectively show the single line diagram for the interconnection of the Projects to present and planned system of SPP. This arrangement was modeled and studied in power flow cases for these projects.

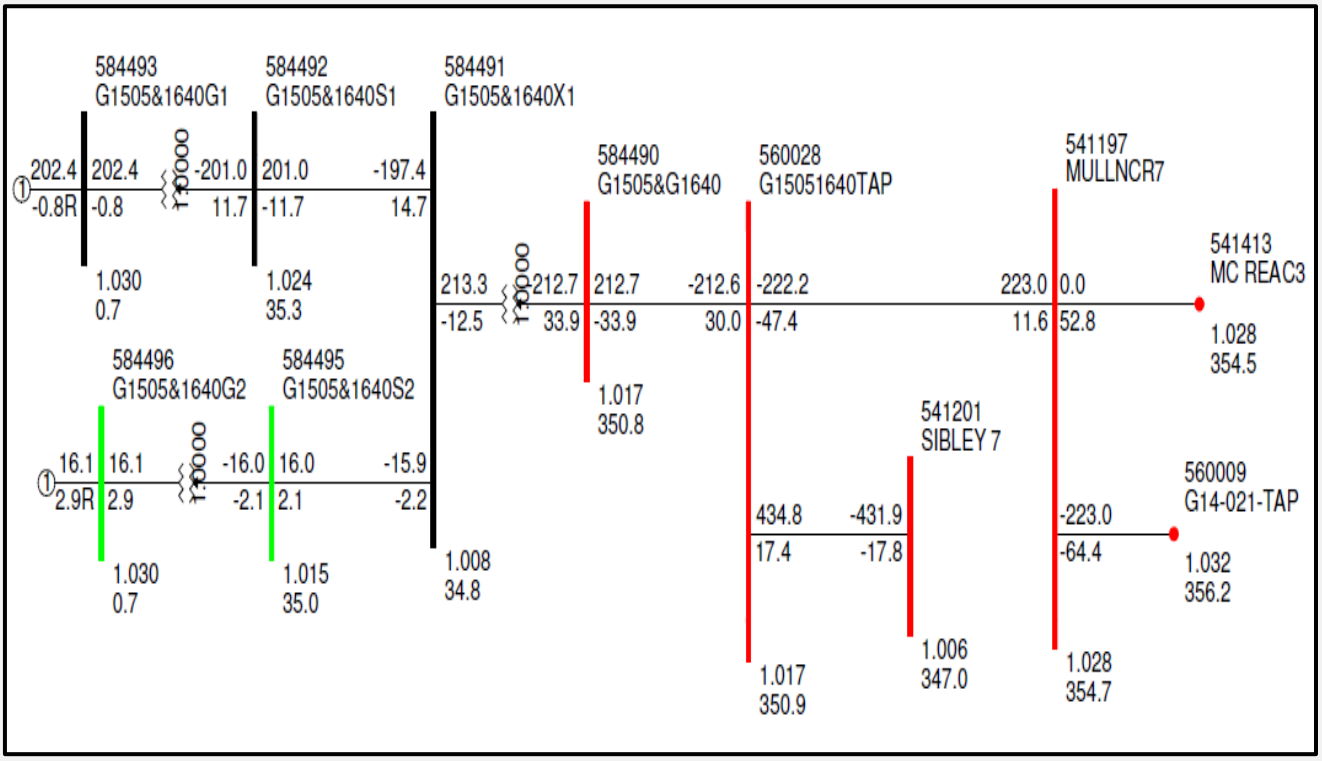

Figure 2.1.1: Power flow single line diagram for GEN-2016-040 and surrounding system components

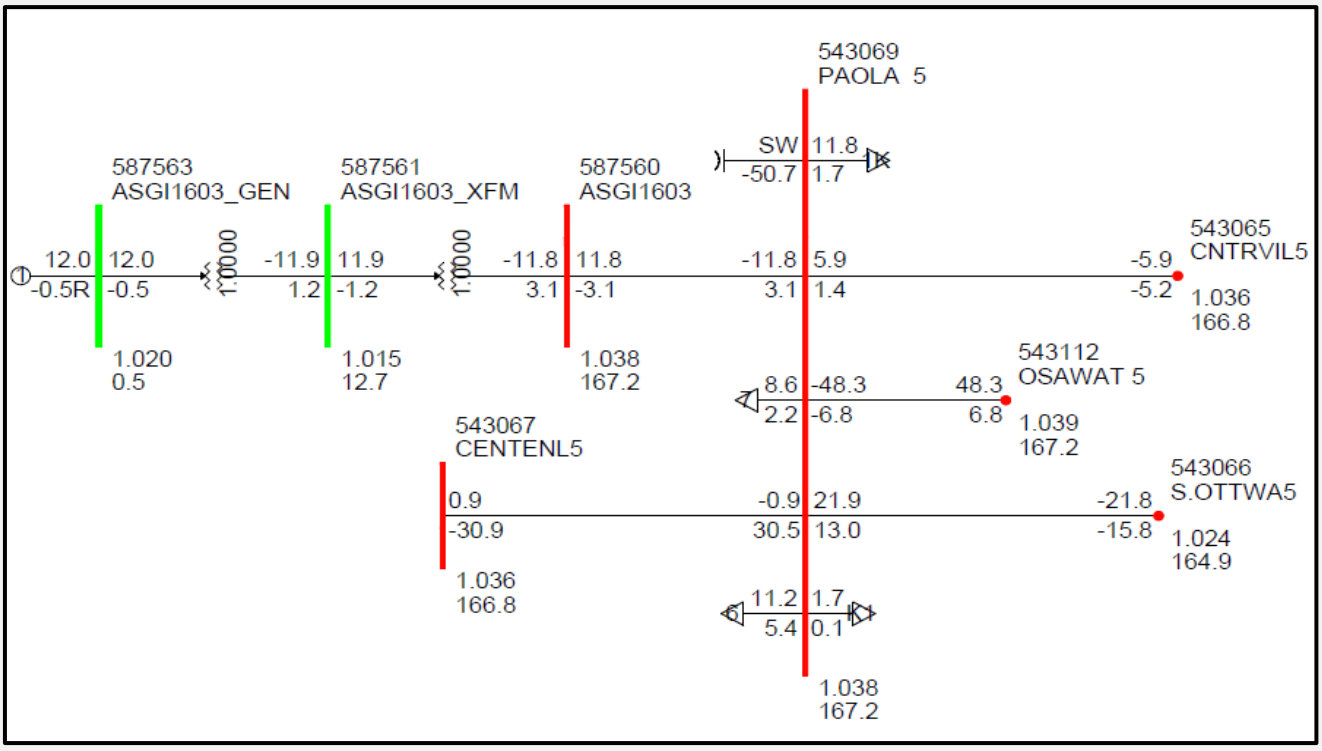

Figure 2.1.2: Power flow single line diagram ASGI-2016-003 and surrounding system components

Appendix-D contains the machines, interconnection, and machines user model parameters.

Table 2.1.2 below shows the list of prior queued projects modeled in the base case.

Table 2.1.2: List of previous queued request projects

Request	Size (MW)	Wind Turbine Model	Point of Interconnection
GEN-2008-129	641/675	Combined Cycle (541163/541164)	Pleasant Hill 161kV (541225)
GEN-2010-036	4.6	GENROU (533264)	6th Street 115kV (533264)
GEN-2011-011	900.0	GENROU (542962)	Iatan 345kV (542982)
ASGI-2013-007	90.0	GE 2.5MW (562454)	Tap Hickory Creek (300087) – Locust Creek (300094) 161kV (562450)
GEN-2014-021	300.0	Vestas V110 2.0MW (583913,583917)	Tap Nebraska City/S3458 (645458) to Mullins Creek (541197) 345kV (560009)
GEN-2015-005	200.1	GE 1.79MW (9 wtg's) and GE 2.0MW (92wtg's)	Nebraska City-Sibley 345kV (bus 560028)

ATC (Available Transfer Capability) studies were not performed as part of this study. These studies will be required at the time transmission service is actually requested. Additional transmission upgrades may be required based on that analysis.

Study assumptions in general have been based on the specific information and data provided by SPP. The accuracy of the conclusions contained within this study is dependent on the assumptions made with respect to other generation additions and transmission improvements planned by other entities. Changes in the assumptions of the timing of other generation additions or transmission improvements may affect this study's conclusions.

2.2. Objectives

The objectives of the study are to conduct power factor analysis, short circuit analysis and to determine the impact on system stability of interconnecting the proposed wind farms to SPP's transmission system.

2.3. Models and Simulations Tools Used

Version 32.2.0 of the Siemens, PSS/E™ power system simulation program was used in this study.

SPP provided its latest stability database cases for Winter-2016, Summer-2017, and Summer-2025 peak seasons. The Project's PSS/E model had been developed prior to this study and was included in the power flow case and the dynamics database. Machines, interconnection and dynamic model data for the Project plants is provided in Appendix D.

Power flow single line diagram of the projects in summer 2017 peak condition are shown in Figure 2.1.1, and Figure 2.1.2 respectively. These figures shows that wind farms model includes representation of the radial transmission line, the substation transformer from transmission voltage (138kV and 345kV) to 34.5V. The remainder of each wind farm is represented by lumped equivalents including a generator, a step-up transformer, and collector system impedance. No special modeling is required of line relays in these cases, except for the special modeling related to the wind-turbine tripping.

All generators in Areas 536, 540, 541, 542, 544, 545, 545, 640, 645, 650, 652, 635, 330, 356 were monitored.

3. Power Factor Analysis

3.1. Methodology

Power factor analysis was conducted for the Project using the following methodology:

1. Replace the wind farm by a generator at the high side bus 345 kV, 138 kV, 115kV, or 69 kV bus, as applicable, with the MW of the wind farms at that point of interconnection.
2. Turn off the wind farm as modeled (as well as previous queued projects at the same point of interconnection).
3. Model a var generator at the Project's high voltage side, 345 kV, 138 kV, 115kV, or 69kV bus, as applicable. The var generator is set to hold a voltage schedule at the POI consistent with the voltage schedule in the provided power flow cases for Summer and Winter or 1.0 pu voltage, whichever is higher.
4. Perform the steady state contingency analysis to determine the power factor necessary at the POI for each contingency.
5. If the required power factor at the POI is beyond the capability of the studied wind turbines to meet (at the POI) capacitor banks may be considered for the stability analysis. The preference is to locate the capacitance banks on the 34.5 kV customer side. Factors to sizing capacitor banks include:
    5.1. The ability of the wind farm to meet FERC Order 661A (low voltage ride through) with and without capacitor banks.
    5.2. The ability of the wind farm to meet FERC Order 661A (wind farm recovery to pre-fault voltage).
    5.3. If wind farms trips on high voltage, power factor lower than unity may be required.

3.2. Analysis

Analysis was performed for the proposed Projects with all prior queued projects in service. A var generator was modeled at the point of interconnection and was set to hold a voltage schedule at the POI consistent with the voltage schedule in the provided power flow cases OR 1 p.u. whichever is higher. The voltages for these Projects are summarized in Table 3.2.1. All upgrades and instructions were made in the base cases. No other changes were made in the base cases provided, other than the addition of the var generators. Contingency analysis was run for provided list of contingencies.

Table 3.2.1: POI voltages for the Summer and Winter peak cases

Request	Point of Interconnection	Size (MW)	Base Case Voltage (p.u.)		
			Winter 2016 Peak	Summer 2017 Peak	Summer 2025 Peak
GEN-2016-040	Nebraska City-Sibley 345kV, (G15051640TAP, 560028)	18.4 uprate to GEN-2015-005 (total 218.5MW)	1.021	1.017	1.018
ASGI-2016-003	Paola 161kV (543069)	12	1.0327	1.0385	1.0344

The details of the var requirement during contingencies are highlighted in Table 3.2.2, 3.2.3 and 3.2.4. The highest and the lowest values obtained are highlighted in these Tables.

1. For 2016 Winter case (GEN-2016-040 analysis): The maximum var generator supply is 101.8 MVARs at 0.91 (lagging power factor) for the outage of 645458 [S3458 3 345.0] TO BUS 560009 [G14-021-TAP 345.0] CKT outage and 541201 [SIBLEY 7 345.0] TO BUS 345408 [7OVERTON 345.0] CKT outage. The minimum var requirement is –56.6 MVARs at 0.97 (leading power factor) for the outage of 541201 [SIBLEY 7 345.0] TO BUS 542972 [HAWTH 7 345.0] CKT outage.
2. For 2016 Winter case (ASGI-2016-003 analysis): The maximum var generator supply is 2.8 MVARs at 0.97 (lagging power factor) for the outage of 645458 [S3458 3 345.0] TO BUS 560009 [G14-021-TAP 345.0] CKT outage and 541201 [SIBLEY 7 345.0] TO BUS 541200 [PHILL 7 345.0] CKT outage. The minimum var requirement is –44.9 MVARs at 0.26 (leading power factor) for the outage of 543069 [PAOLA 5 161.0] TO BUS 543067 [CENTENL5 161.0] CKT outage and 543069 [PAOLA 5 161.0] TO BUS 543066 [S.OTTWA5 161.0] CKT outage.

Note: FLT08-3PH was not simulated since it was making Small Island for GEN-2014-021345.

3. For 2017 Summer case (GEN-2016-040 analysis): The maximum var generator supply is 94.8 MVARs at 0.92 (lagging power factor) for the outage of 645458 [S3458 3 345.0] TO BUS 560009 [G14-021-TAP 345.0] CKT outage and 541201 [SIBLEY 7 345.0] TO BUS 345408 [7OVERTON 345.0] CKT outage. The minimum var requirement is –52.4 MVARs at 0.97 (leading power factor) for the outage of 541201 [SIBLEY 7 345.0] TO BUS 542972 [HAWTH 7 345.0] CKT outage.

4. For 2017 Summer case (ASGI-2016-003 analysis): The maximum var generator supply is 6.0 MVARs at 0.89 (lagging power factor) for the outage of 543066 [S.OTTWA5 161.0] TO BUS 543055 [SEOTTWA5 161.0] CKT outage. The minimum var requirement is –50.2 MVARs at 0.23 (leading power factor) for the outage of 543069 [PAOLA 5 161.0] TO BUS 543067 [CENTENL5 161.0] CKT outage and 543069 [PAOLA 5 161.0] TO BUS 543066 [S.OTTWA5 161.0] CKT outage.

3.3. Conclusions

The power factor analysis indicates the DISIS-2016-001 (Group 13) interconnection requests i.e., GEN-2016-040, and ASGI-2016-003 are required to maintain the SPP standard power factor at the point of interconnection i.e., Nebraska City-Sibley 345kV (G15051640TAP, 560028), and Paola 161kV (543069) based on the contingencies studied.

Per the SPP OATT, the Interconnection Customer will be required to provide 95% lagging (supplying vars) and 95% leading (absorbing vars) at the POI.

4. Inductive Reactive Support Analysis

Analysis for low wind/no wind conditions in cluster scenario is performed for the proposed wind generator request. To offset the capacitive effects of the collector system and transmission line of the wind farm under low wind or no wind conditions, analysis was performed for Summer 2017 scenario to calculate the Inductive Reactive Support at point of interconnection for each interconnection request under project DISIS-2016-001 (Group 13) .

Following methodology was adopted as communicated by SPP:

1. Switch the generator and capacitor bank (if installed) out of service with the collector system as modeled remaining in service.
2. Calculate the amount of inductive reactive support required at the 34.5kV collector buses which would result in zero VAR flow at the POI."

The inductive reactive support analysis for wind generator GEN-2016-040 performed for Summer-2017 scenario which indicates that at POI Nebraska City-Sibley 345kV (G15051640TAP, 560028) 9.1 MVAR reactor is required at Bus 584490 to maintain zero MVAR flow at POI.

Maintaining zero MVAR flow at the POI at all times is not possible with static reactor banks. It will be determined on a case by case basis for each generator as to whether additional reactor banks are required for low wind conditions.

The single line diagram for wind generators showing the inductive reactive requirement for GEN-2016-040 is shown in Figure 4.1 below:

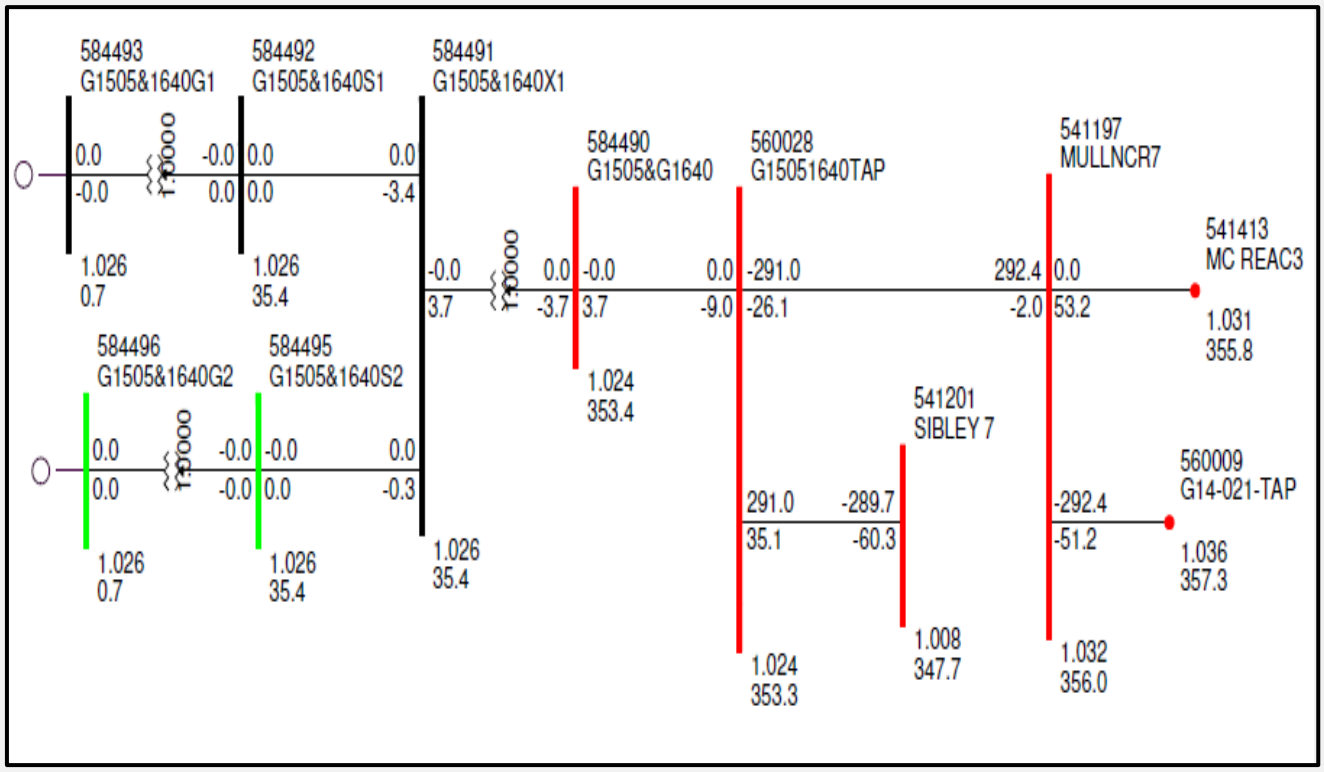

Figure 4.1.1: Inductive reactive requirement for GEN-2016-040

5. Short Circuit Analysis

The short circuit analysis out five buses away was performed for 2017 and 2025 summer peak case for the interconnection requests under project cluster scenario of DISIS-2016-001 (Group 13). No outage was assumed in the system model.

5.1. Short Circuit Result for 2017 Summer Peak Case

The short circuit results for Summer-2017 scenario (assumed not outage) at the POI are tabulated below

5.1.1. Short Circuit Result for Nebraska City-Sibley 345kV (G15051640TAP, 560028)

The results of the short circuit analysis for POI i.e., Nebraska City-Sibley 345kV (G15051640TAP, 560028) and five bus levels away are tabulated below in Table 5.1.1.

Table 5.1.1: Short circuit results for Nebraska City-Sibley 345kV (G15051640TAP, 560028) (GEN-2016-040)

5.2. Short Circuit Result for 2025 Summer Peak Case

The short circuit results for Summer-2025 scenario (assumed not outage) at each POI are tabulated below

5.2.1. Short Circuit Result for Fort Randall (652509) – Utica Jct (652526) 230kV line (652593)

The results of the short circuit analysis for POI i.e., Nebraska City-Sibley 345kV (G15051640TAP, 560028) and five bus levels away are tabulated below in Table 5.2.1.

Table 5.2.1: Short circuit results for Nebraska City-Sibley 345kV (G15051640TAP, 560028) (GEN-2016-040)

6. Stability Analysis for Cluster Scenario

6.1. Faults Simulated

Thirty six (36) faults were considered for the transient stability simulations which included three phase faults, as well as single phase line faults. Single-phase line faults were simulated by applying fault impedance to the positive

sequence network at the fault location. As per the SPP current practice to compute the fault levels, the fault impedance was computed to give a positive sequence voltage at the specified fault location of approximately 60% of pre-fault voltage.

Concurrently and previously queued projects as respectively shown in Table-1 and Table-2 of the study request i.e., GEN-2008-129, GEN-2010-036, GEN-2011-011, ASGI-2013-007, GEN-2014-021, and GEN-2015-005 as well as areas number 536, 540, 541, 542, 544, 545, 545, 640, 645, 650, 652, 635, 330, and 356 were monitored during all the simulations. Table 6.1.1 shows the list of simulated contingencies. This Table also shows the fault clearing time and the time delay before re-closing for all the study contingencies.

Simulations were performed with a 0.1-second steady-state run followed by the appropriate disturbance as described in Table 6.1.1. Simulations were run for minimum 15-second duration to confirm proper machine damping.

Table 6.1.1 summarizes the overall results for all faults simulations of cluster scenario. Complete sets of plots for Winter-2016, Summer-2017, and Summer-2025 peak seasons for each fault are included in Appendices A, B and C respectively.

Table 6.1.1: List of simulated faults for cluster scenario stability analysis

Cont. #	Contingency Name	Description	2016 Winter Results	2017 Summer Results	2025 Summer Results
1	FLT01-3PH	3 phase fault on the G15-005 TAP (560028) to Sibley (541201) 345kV line circuit 1, near G15-005 TAP. a. Apply fault at the G15-005 TAP 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	Stable	Stable	Stable
2	FLT02-3PH	3 phase fault on the G15-005 TAP (560028) to Mullin Creek (541197) 345kV line circuit 1, near G15-005 TAP. a. Apply fault at the G15-005 TAP 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	Stable	Stable	Stable
3	FLT03-3PH	3 phase fault on the MULLNCR7 (541197) to G14-021-TAP (560009) 345kV line, near MULLNCR7. a. Apply fault at the MULLNCR7 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	Stable	Stable	Stable
4	FLT04-3PH	3 phase fault on the SIBLEY 7 (541201) to 7OVERTON (345408) 345kV line, near SIBLEY 7. a. Apply fault at the SIBLEY 7 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	Stable	Stable	Stable
5	FLT05-3PH	3 phase fault on the SIBLEY 7 (541201) to HAWTH 7 (542972) 345kV line, near SIBLEY 7 a. Apply fault at the SIBLEY 7 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. 6.2. Simulation Results for Cluster Scenario

For cluster scenario, there are no impacts on the stability performance of the SPP system for the contingencies tested on the SPP provided base cases.

7. Stability Analysis for Stand-Alone Scenarios

For stand-alone scenario, selective contingencies are simulated for each interconnection request at 100% capacity of each generator at the POI.

7.1. Fault Simulated for GEN-2016-040 Request

Table 7.1.1, summarizes the overall results for all simulations for GEN-2016-040 request. Complete sets of plots for winter-2016, summer-2017, and summer-2025 peak seasons for each fault for GEN-2016-040 are in Appendices E1, E2, and E3 respectively.

Table 7.1.1: List of simulated faults for stand-alone stability analysis (GEN-2016-040)

7.3.Simulation Results for Stand-Alone Scenarios

There are no impacts on the stability performance for stand-alone scenarios of the SPP system for the contingencies tested on the SPP provided base cases.

8. Conclusions

The findings of the impact study for the proposed interconnection projects under DISIS-2016-001 (Group 13) considered 100% of their proposed installed capacity is as follows:

1. The power factor analysis indicates the DISIS-2016-001 (Group 13) interconnection requests i.e., GEN-2016-040, and ASGI-2016-003 are required to maintain the SPP standard power factor at the point of interconnection i.e., Nebraska City-Sibley 345kV (G15051640TAP, 560028), and Paola 161kV (543069) based on the contingencies studied. Per the SPP OATT, the Interconnection Customer will be required to provide 95% lagging (supplying vars) and 95% leading (absorbing vars) at the POI.

2. To offset the capacitive effects of the collector system and transmission line of the wind farm under low wind or no wind conditions, the inductive reactive support analysis for wind generator GEN-2016-040 performed for Summer-2017 scenario. This analysis indicates that at POI Nebraska City-Sibley 345kV (G15051640TAP, 560028) 9.1 MVAR reactor is required at Bus 584490 to maintain zero MVAR flow at POI. Maintaining zero MVARs flow at the POI at all times is not possible with static reactor banks. It will be determined on a case by case basis for each generator as to whether additional reactor banks are required for low wind conditions.

3. There are no impacts on the stability performance of the SPP system during cluster scenario for the contingencies tested on the provided base cases. The study machines stayed on-line and stable for all simulated faults. The project stability simulations with thirty six (36) specified test disturbances did not show instability problems in the SPP system. Any oscillations were damped out.

1. EXECUTIVE SUMMARY

S&C Electric Company (S&C) has performed several analyses as part of a Definitive Interconnection System Impact Study, DISIS-2016-001 (Group 14), in response to a request through Southwest Power Pool (SPP) to administer a subsection of Attachment V to the SPP Open Access Transmission Tariff (Tariff). Group 14 consists of five (5) new generator interconnection requests (GEN-2015-036, GEN-2016-028, GEN-2016-030, GEN-2016-042, and GEN-2016-063).

S&C has performed dynamic stability analysis for Group 14 under Cluster and Stand-Alone (SA) scenarios. The cluster studies were performed using three (3) cluster base cases (2016 Winter Peak (WP), 2017 Summer Peak (SP), and 2025 SP) provided by SPP. In the cluster studies, all five new interconnection requests and prior-queued projects were studied at 100% of nameplate MW capacity. The standalone studies were performed using three (3) standalone base cases (2016 WP, 2017 SP, and 2025 SP) provided by SPP and by placing an interconnection request into service, one at a time. The in-service interconnection project was dispatched at 100% power and the four (4) out of service interconnection projects were set to zero generation or to its pre-project value if the project is an increase to an existing project or facility. The dynamic stability study revealed that Group 14 projects met the SPP transient voltage requirements, with the solutions illustrated in the dynamic stability results section of this report.

S&C has performed power factor analysis on Group 14 Cluster scenarios. Power factor analysis reported the power factors at the study projects point of interconnection (POI) for all N-1 three-phase contingencies and marked the contingency at which the required power factor at the POI of study projects to maintain the voltages at the desired level is beyond the normal required capability (from 0.95 lagging to 0.95 leading) of the studied projects. The power factor requirement for GEN-2015-036, GEN-2016-028, GEN-2016-030, GEN-2016-042, and GEN-2016-063 interconnection requests is from 0.95 lagging to 0.95 leading power factor at the POIs.

S&C has performed an analysis of low wind/low solar irradiance conditions for interconnection requests that are renewable energy projects. The low wind/low solar irradiance analysis was performed only under the cluster cases by taking the interconnection generation out of service

and determining the Mvar size of a shunt reactor to offset the reactive power generated from the capacitance of the project's transmission lines and collector cables. The shunt reactor Mvars are given in Section 8.

S&C has performed a short-circuit analysis for the 2017 Summer Peak and 2025 Summer Peak under Group 14 Cluster and reported short circuit results at all buses up to five (5) levels away from the POI of the study projects.

2. INTRODUCTION

S&C has performed several analyses as part of a Definitive Interconnection System Impact Study, DISIS-2016-001 (Group 14), in response to a request through the SPP to administer a subsection of Attachment V to the SPP Tariff (Tariff). Group 14 consist of five (5) new interconnection requests listed in

Table 1 and eight (8) previously queued projects listed in

Request	Size (MW)	Generator Model	Point of Interconnection
GEN-2011-040	110.4	Siemens 2.3MW	Tap Ratliff – Poolville 138 kV (515561)
GEN-2011-050	109.8	Vestas V90 1.8MW	Tap on the Rushspt4 to Ommarlo4 138 kV line (G11_050-TAP 138 kV, 511492)
GEN-2012-004	41.4MW increase (total output 151.8MW)	Siemens 2.3MW	Tap Ratliff – Poolville 138 kV (515561)
GEN-2013-007	100.0	Vestas V100 2.0MW	Arbuckle to Jollyville 138 kV (515575)
GEN-2014-057	250.0	GE 2.1MW	LES (511468) to Sunnyside (515136) 345 kV (Proposed AEP Terry Road 345 kV, 560013)
ASGI-2015-006	9.0	Eaton Xpert Solar 1500kW Inverter (solar)	SWPA Tupelo 138 kV (505600)
GEN-2015-045	20.0	Parker 890GT-B 2.0MW inverters (battery storage)	LES (511468) to Sunnyside (515136) 345 kV (Proposed AEP Terry Road 345 kV, 560013)
GEN-2015-092	250.0	GE 2.0MW (wind)	LES (511468) to Sunnyside (515136) 345 kV (Proposed AEP Terry Road 345 kV, 560013)

Table 2.

Table 1: Group 1 Generation Interconnection Requests

Project	Size (MW)	Generator Model	Generator Bus(es)	Point of Interconnection (POI)	POI Bus

GEN-2016-028	100	Vestas V110 VCSS 2.0 MW (wind)	587183	Clayton 138 kV	510919
GEN-2016-030	100	AE 500NX 0.5MW (solar)	587203	Brown 138 kV	515157
GEN-2016-042	22 uprate to GEN-2014-057 (total = 270.9MW)	GE 2.3MW & 1.79MW (wind)	584073	Tap on LES to Sunnyside 345kV	560013
GEN-2016-063	200	Vestas V110 VCSS 2.0MW	587433 / 587436	Tap on Hugo to Sunnyside 345kV	560088

Table 2: Prior Queued Projects

Request	Size (MW)	Generator Model	Point of Interconnection
GEN-2011-040	110.4	Siemens 2.3MW	Tap Ratliff – Poolville 138 kV (515561)
GEN-2011-050	109.8	Vestas V90 1.8MW	Tap on the Rushspt4 to Ommarlo4 138 kV line (G11_050-TAP 138 kV, 511492)
GEN-2012-004	41.4MW increase (total output 151.8MW)	Siemens 2.3MW	Tap Ratliff – Poolville 138 kV (515561)
GEN-2013-007	100.0	Vestas V100 2.0MW	Arbuckle to Jollyville 138 kV (515575)
GEN-2014-057	250.0	GE 2.1MW	LES (511468) to Sunnyside (515136) 345 kV (Proposed AEP Terry Road 345 kV, 560013)
ASGI-2015-006	9.0	Eaton Xpert Solar 1500kW Inverter (solar)	SWPA Tupelo 138 kV (505600)
GEN-2015-045	20.0	Parker 890GT-B 2.0MW inverters (battery storage)	LES (511468) to Sunnyside (515136) 345 kV (Proposed AEP Terry Road 345 kV, 560013)
GEN-2015-092	250.0	GE 2.0MW (wind)	LES (511468) to Sunnyside (515136) 345 kV (Proposed AEP Terry Road 345 kV, 560013)

3. TRANSMISSION SYSTEM AND STUDY AREA

The interconnection requests in Group 14 will interconnect into American Electric Power West (AEPW, Area #520) and Oklahoma Gas & Electric (OKGE, Area #524).

In addition to Areas #520 and #524, the following areas were monitored also:

- Western Farmers Electric Cooperative (WFEC, Area #525)
- Southwestern Public Service (SPS, Area #526)
- Midwest Energy (MIDW, Area #531)
- Sunflower Electric Power Corporation (SUNC, Area #534)
- Westar Energy, Inc. (WERE, Area #536)

4. POWER FLOW BASE CASES

DISIS-2016-001 (Group 14) and prior-queued projects were modeled as aggregated generating units in the base cases from SPP.

Cluster Scenario Base Cases

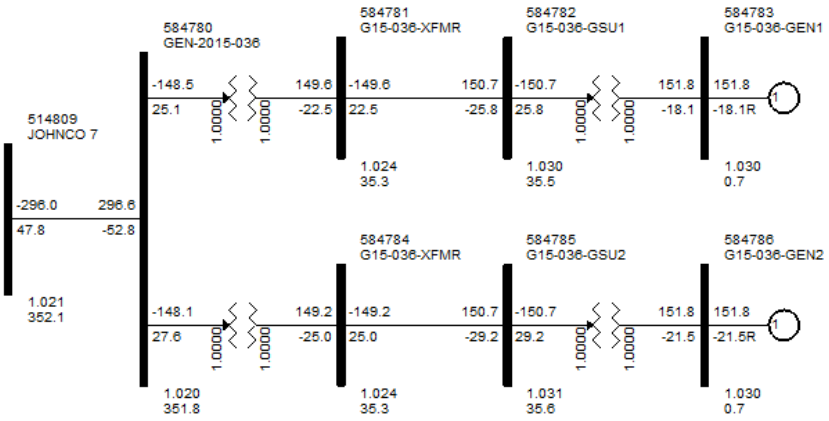
- **MDWG15-16WP_DIS1601_G14.sav** – 2016 Winter Peak Cluster Base Case for Group 14. New interconnection requests and prior queued projects at 100% output power.
- **MDWG15-17SP_DIS1601_G14.sav** – 2017 Summer Peak Cluster Base Case for Group 14. New interconnection requests and prior queued projects at 100% output power.
- **MDWG15-25SP_DIS1601_G14.sav** – 2025 Summer Peak Cluster Base Case for Group 14. New interconnection requests and prior queued projects at 100% output power.

Stand-Alone Scenario Base Cases

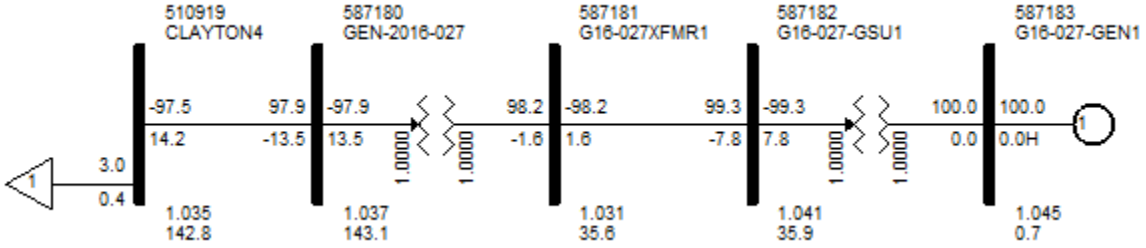
- **MDWG15-16WP_DIS1601_G14_SA.sav** – 2016 Winter Peak SA Base Case for Group 14. New interconnection requests currently out of service.
- **MDWG15-17SP_DIS1601_G14_SA.sav** – 2017 Summer Peak SA Base Case for Group 14. New interconnection requests currently out of service.
- **MDWG15-25SP_DIS1601_G14_SA.sav** – 2025 Summer Peak SA Base Case for Group 14. New interconnection requests currently out of service.

5. POWER FLOW MODEL

SPP's base case power flow models were built in PSS/E 32.2.1. In PSS/E of the same version, S&C created one-line diagrams depicted in Figure 1 for each interconnection request.

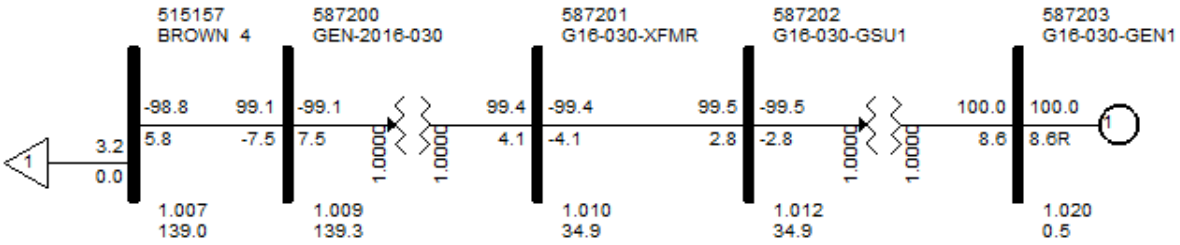


(a) Interconnection request GEN-2015-036

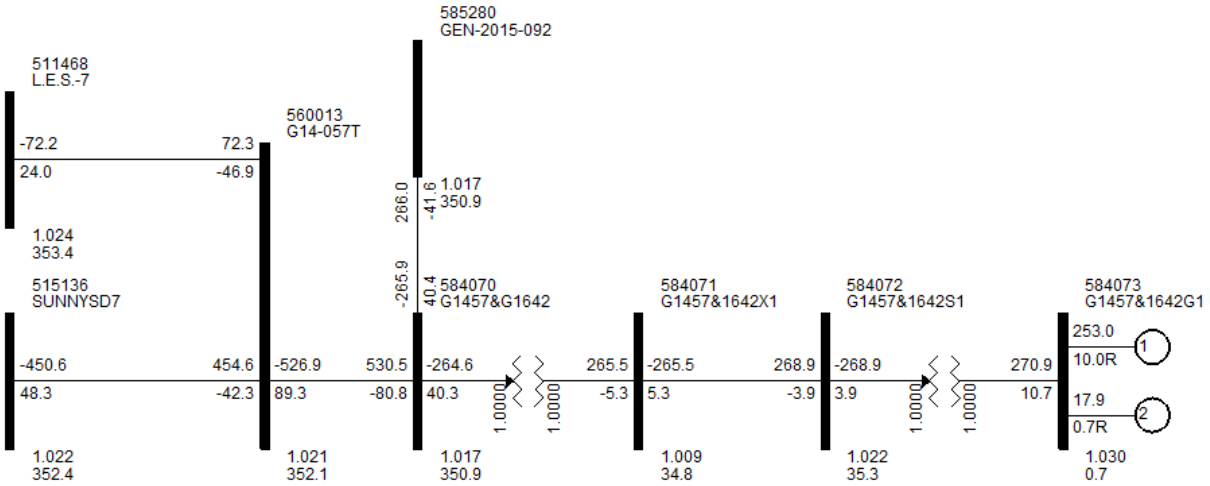


(b) Interconnection request GEN-2016-028

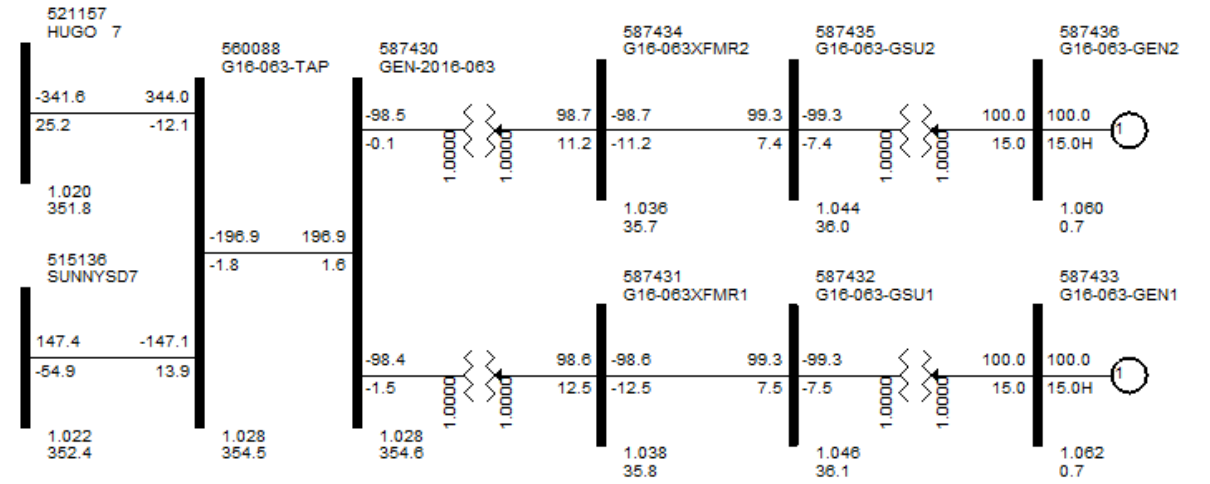
Note: Per SPP, GEN-2016-028 is the correct naming convention (not GEN-2016-027 as shown above)



(c) Interconnection request GEN-2016-030



(d) Interconnection request GEN-2016-042



(e) Interconnection request GEN-2016-063

Figure 1: One-line Diagrams of the Interconnection Request Projects

6. DYNAMIC STABILITY ANALYSIS

6.1. ASSUMPTIONS

Dynamic stability analysis was performed for all the SPP contingencies listed in Appendix A. Three phase faults were simulated as bolted faults, while single line-to-ground faults were simulated under the assumption that a single line-to-ground fault will cause a 40% drop in the positive-sequence voltage at the fault location.

6.2. STABILITY CRITERIA

Dynamic stability studies were performed to ensure system stability following critical faults on the system. The system is considered stable if the following conditions are met:

(1) Disturbances including three-phase and single-phase to ground faults, should not cause synchronous and asynchronous plants to disconnect from the transmission grid.

(2) The angular positions of synchronous machine rotor become constant following an aperiodic system disturbance.

(3) Voltage magnitudes and frequencies at terminals of asynchronous generators should not exceed magnitudes and durations that will cause protection elements to operate. Furthermore, the response after the disturbance needs to be studied at the terminals of the machine to ensure that there are no sustained oscillations in power output, speed, frequency, etc.

(4) Voltage magnitudes and angles after the disturbance should settle to a constant and acceptable operating level. Frequencies should settle to the acceptable range within nominal 60 Hz power frequency.

In addition, performance of the transmission system is measured against the SPP Disturbance Criteria Requirements on Angular oscillations and Transient Voltage Recovery, detailed in Appendix B.

6.3. DYNAMIC STABILITY RESULTS

Some concerns surfaced during preliminary dynamic stability simulations. A detailed list of such concerns and how they were addressed is shown below.

- Generation Interconnection Request GEN-2016-030 (involving AE solar inverters) was tripping offline due to overfrequency during FLTs 38-45 and FLTs 52-56.
    - This issue was also encountered and discussed with SPP in the previous DISIS-2015-002 GR7 study. In this previous study, SPP provided an IDV file titled "GEN-2015-055_AEINX_OverFreq_extended.idv" to change the over-frequency parameters. The same IDV file was also applied during this study.

- High voltage conditions were observed near Generation Interconnection Request GEN-2016-028 in the stand-alone cases.
    - To resolve the issue, the reactive power output of GEN-2016-028 was changed to $Q_{GEN} = Q_{MAX} = Q_{MIN} = 0$ Mvar to match the Cluster cases. Such an adjustment is acceptable for the Vestas turbines (provided a power factor range of +0.98 to -0.96 is maintained).

Dynamic stability simulations were performed once again after implementing the solutions described above. Table 3 below summarizes the dynamic stability results for each contingency and each season.

Table 3: Group 14 Dynamic Stability Results

[1] To initialize the case, a modification was made to ASGI-2011-001 to correct an issue with the dynamic model of the Suzlon wind turbine. More specifically, “Winding (1-2) Angle” of the GSU transformer attached to bus 579423 was changed to -30°.

In reviewing the results of Table 3, it should be noted that occasional poor damping were witnessed with regards to the terminal voltage of Prior Queued Project GEN-2015-045. The figure below demonstrates some examples of these abnormalities.

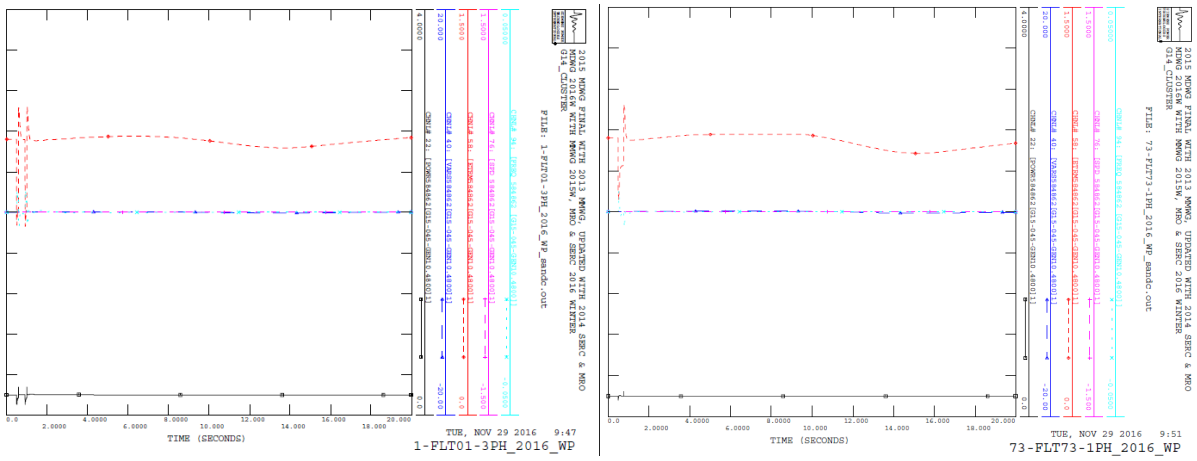

Figure 2: Examples of Voltage Poor Damping With GEN-2015-045 (Red)
Left = FLT01 from 2016WP Cluster Case
Right = FLT73 from 2016WP Cluster Case

However, since the voltage waveforms in the figure above fall within the specified post-transient voltage range, these results were considered stable. As a result, dynamic stability analysis thus concluded that Group 14 is expected to successfully ride-through all contingencies specified by SPP and the nearby areas retained frequency and voltage stability. Detailed plots of cluster dynamic stability results for each contingency and each peak season, are given in Appendix C. Plots of stand-alone dynamic stability result for each contingency and each season are given Appendix D.

7. Power Factor Analysis

The power factor analysis was performed under the cluster bases and for all N-1 three-phase contingencies shown in the Fault Definition table in Appendix A. Single-phase contingencies, N-1-1 contingencies and N-2 contingencies were excluded from the study. Prior to the run, the cluster base cases were slightly altered, by turning off the renewable energy projects and replacing them by a generator at the high voltage bus with the MW rating of the renewable project at that POI and no var capability. A new var generator was placed at each renewable energy project high voltage bus for supporting the reactive power. The var generators were set to hold the voltage schedule at the interconnection project consistent with the voltage schedules in the provided base case or 1.0 p.u. voltage (whichever is higher).

Table 4 gives the voltage schedule at each interconnection request location in the original cluster base cases.

Table 4: Base Case Voltages at the Interconnection Request POI Bus

Request	POI	2016 Winter Peak (p.u.)	2017 Summer Peak (p.u.)	2025 Summer Peak (p.u.)
GEN-2015-036	514809	1.021	1.021	1.023
GEN-2016-028	510919	1.035	1.035	1.032
GEN-2016-030	515157	1.007	1.001	1.000
GEN-2016-042	560013	1.021	1.021	1.019
GEN-2016-063	560088	1.028	1.032	1.038

The power factor analysis results for Group 14 interconnection requests for each N-1 three phase contingency were presented in Appendix E. We marked in pink color the contingencies (if any) at which the required power factor at the POI of the study project is beyond the normal required capability (from 0.95 lagging to 0.95 leading) of the studied renewable energy project. We also provided a summary Table 5 of the maximum leading/lagging reactive power demand and power factor found by the power factor analysis at the POIs.

The power factor requirement for GEN-2015-036, GEN-2016-028, GEN-2016-030, GEN-2016-042, and GEN-2016-063 interconnection requests is from 0.95 lagging to 0.95 leading power factor at the POIs.

Table 5: Summary of Power Factor Analysis at the POI

Request	Capacity	POI	Reactive Power/Power Factor at the POI	
			Leading (absorbing vars)	Lagging (providing vars)
GEN-2015-036	303.6 MW	514809	-79.6 Mvar / 0.967	N/A
GEN-2016-028	100 MW	510919	-18.8 Mvar / 0.983	N/A
GEN-2016-030	100 MW	515157	-15.6 Mvar / 0.988	26.4 Mvar / 0.967
GEN-2016-042	Total = 270.9 MW	560013	-103.4 Mvar / 0.982*	N/A*
GEN-2016-063	200 MW	560088	-26.3 Mvar / 0.991	41.4 Mvar / 0.979

**Bus 584070 is the substation high side bus for GEN-2016-042. Bus 584070 is also connected to the substation high side bus for Prior-Queued Projects GEN-2015-045 and GEN-2015-092. The value shown corresponds to the power factor results for all these projects ($P_{TOTAL} \approx 541$ MW).*

NOTE: Per the SPP Tariff as reactive power is required for all projects, the final requirement in the GIA will be the pro-forma 95% lagging to 95% leading at the point of interconnection.

8. Low Wind/Low Solar irradiance Conditions Analysis

S&C has performed an analysis of low wind/low solar irradiance conditions for the interconnection requests that is a renewable energy project. The low wind/low solar irradiance analysis was performed under the Cluster scenarios by taking the interconnection renewable energy project out of service and placing a shunt reactor at the project substation high side to offset the reactive power generated from the capacitance of the project's transmission lines and collector cables. The size of the shunt reactor was adjusted such that the net Mvar flow into the POI from the studied renewable energy project was approximately zero. Table 6 gives the shunt reactor Mvars for the studied projects.

Table 6: Shunt Reactor Mvar Determined by Low Wind/Low Irradiance Study

Request	POI	2016 Winter Peak	2017 Summer Peak	2025 Summer Peak
GEN-2015-036	514809	20.0	20.0	20.0
GEN-2016-028	510919	8.4	8.4	8.4
GEN-2016-030	515157	4.9	4.9	4.9
GEN-2016-042	560013	33.1*	33.1*	33.1*
GEN-2016-063	560088	10.1	10.1	10.1

**Bus 584070 is the substation high side bus for GEN-2016-042. Bus 584070 is also connected to the substation high side bus for Prior Queued Projects GEN-2015-045 and GEN-2015-092. The value shown corresponds to the reactor requirement for all these projects ($P_{TOTAL} \approx 541$ MW).*

9. SHORT-CIRCUIT STUDY

A short-circuit study has been performed on the power flow models for the 2017 SP and 2025 SP Seasons for each generator using the Cluster Scenario model. Short-circuit analysis includes applying a 3-phase fault on buses up to 5 levels away from the POI of each interconnection request project. PSS/E "Automatic Sequence Fault Calculation (ASCC)" fault analysis module was used for the purpose of short-circuit analysis. The results of the short-circuit analysis have been recorded for all the buses up to five levels away from the point of interconnection of each interconnection request project. Detailed results of the short-circuit study are provided in Appendix F.

10. CONCLUSIONS AND RECOMMENDATIONS

With the adjustments mentioned in Section 6, Group 14's dynamic results (Cluster and Stand-Alone) indicated that the interconnection request projects are expected to successfully ride through all N-1, N-1-1, and N-2 fault contingencies specified by SPP, retaining angular, frequency and voltage stability at the nearby areas and meeting the transient voltage recovery requirement by SPP. It is thus concluded that Group 14 study projects are expected to successfully interconnect into the transmission system at their desired locations for 100% power outputs.

The results of power factor analysis indicate that all the interconnection requests are able to maintain a power factor of 0.95 lagging to 0.95 leading at the POI to meet SPP's requirements.

The project's low wind/low solar irradiance study suggested that to offset the reactive power from the capacitance of the project's transmission lines and collector cables during the low wind/low irradiance conditions, a 20.0 Mvar shunt reactor size is required for the POI bus #514809, 8.4 Mvar for the POI bus #510919, 4.9 Mvar for the POI bus #515157, 33.1 Mvar for the POI bus #560013 (including prior-queued projects), and a 10.1 Mvar for the POI bus #560088.

A short-circuit study has been performed on the power flow models for the 2017 Summer Peak Season and 2025 Summer Peak Season for each generator using the Cluster Scenario model. A 3-phase fault is applied on buses up to 5 levels away from the POI of each interconnection request project and the results of the study have been presented.

APPENDIX A

SPP GROUP 14 FAULT DEFINITIONS

Fault Definitions

Cont. No.	Cont. Name	Description
1	FLT01-3PH	3 phase fault on JOHNCO 7 345 kV (514809) to PITTSB-7 345 kV (510907), near JOHNCO 7. a. Apply fault at the JOHNCO 7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
2	FLT02-3PH	3 phase fault on the JOHNCO 7 345 kV (514809) to JOHNCO 4 138 kV (514808) to JOHNCO11 13.8 kV (514810) XFMR, near JOHNCO 7 345 kV. a. Apply fault at the JOHNCO 7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted transformer.
3	FLT03-3PH	3 phase fault on JOHNCO 7 345 kV (514809) to SUNNYSD7 345 kV (515136), near JOHNCO 7. a. Apply fault at the JOHNCO 7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
4	FLT04-3PH	3 phase fault on PITTSB-7 345 kV (510907) to VALIANT7 345 kV (510911), near PITTSB-7. a. Apply fault at the PITTSB-7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
5	FLT05-3PH	3 phase fault on PITTSB-7 345 kV (510907) to SEMINOL7 345 kV (515045), near PITTSB-7. a. Apply fault at the PITTSB-7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
6	FLT06-3PH	3 phase fault on PITTSB-7 345 kV (510907) to C-RIVER7 345 kV (515422), near PITTSB-7. a. Apply fault at the PITTSB-7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
7	FLT07-3PH	3 phase fault on JOHNCO 4 138 kV (514808) to RUSSET-4 138 kV (515120), near JOHNCO 4. a. Apply fault at the JOHNCO 4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Fault Definitions

Cont. No.	Cont. Name	Description
8	FLT08-3PH	3 phase fault on JOHNCO 4 138 kV (514808) to SXMLCKT4 138 kV (515122), near JOHNCO 4. a. Apply fault at the JOHNCO 4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
9	FLT09-3PH	3 phase fault on JOHNCO 4 138 kV (514808) to CANEYCK4 138 kV (515150), near JOHNCO 4. a. Apply fault at the JOHNCO 4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
10	FLT10-3PH	3 phase fault on SUNNYSD7 345 kV (515136) to G14-057T 345 kV (560013), near SUNNYSD7. a. Apply fault at the SUNNYSD7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
11	FLT11-3PH	3 phase fault on the SUNNYSD7 345 kV (515136) to SUNNYSD4 138 kV (515135) to SUNNYSD1 13.8 kV (515762) XFMR, near SUNNYSD7 345 kV. a. Apply fault at the SUNNYSD7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted transformer.
12	FLT12-3PH	3 phase fault on SUNNYSD7 345 kV (515136) to G16-063-TAP 345 kV (560088), near SUNNYSD7. a. Apply fault at the SUNNYSD7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
13	FLT13-SB	**Stuck Breaker at JOHNCO 7 (514809)** a. Apply single phase fault at JOHNCO 7 bus. b. Clear fault after 16 cycles and trip the following elements c. JOHNCO 7 (514809) - PITTSB-7 (510907) d. JOHNCO 7 (514809) - SUNNYSD7 (515136)
14	FLT14-SB	**Stuck Breaker at JOHNCO 7 (514809)** a. Apply single phase fault at JOHNCO 7 bus. b. Clear fault after 16 cycles and trip the following elements c. JOHNCO 7 (514809) - PITTSB-7 (510907) d. JOHNCO 7 345kV (514809) / JOHNCO 4 138 kV (514808) / JOHNCO11 13.8 kV (514810) transformer

19	FLT19-PO	**Prior Outage of JOHNCO 7 (514809) to PITTSB-7 (510907) line;** 3 phase fault on JOHNCO 7 (514809) – SUNNYSD7 (515136) near JOHNCO 7 a. Apply fault at the JOHNCO 7 bus. b. Clear fault after 5 cycles and trip the faulted line.
20	FLT20-PO	**Prior Outage of JOHNCO 7 (514809) to PITTSB-7 (510907) line;** 3 phase fault on the JOHNCO 7 345kV (514809) / JOHNCO 4 138 kV (514808) / JOHNCO11 13.8 kV (514810) transformer near JOHNCO 7 a. Apply fault at the JOHNCO 7 bus. b. Clear fault after 5 cycles and trip the faulted line.
21	FLT21-PO	**Prior Outage of JOHNCO 7 (514809) to SUNNYSD7 (515136) line;** 3 phase fault on the JOHNCO 7 345kV (514809) / JOHNCO 4 138 kV (514808) / JOHNCO11 13.8 kV (514810) transformer near JOHNCO 7 a. Apply fault at the JOHNCO 7 bus. b. Clear fault after 5 cycles and trip the faulted line.
22	FLT22-PO	**Prior Outage of SUNNYSD7 (515136) to G14-057T (560013) line;** 3 phase fault on SUNNYSD7 (515136) – JOHNCO 7 (514809) near SUNNYSD7 a. Apply fault at the SUNNYSD7 bus. b. Clear fault after 5 cycles and trip the faulted line.

Fault Definitions

Cont. No.	Cont. Name	Description
23	FLT23-PO	**Prior Outage of SUNNYSD7 (515136) to G16-063-TAP (560088) line;** 3 phase fault on SUNNYSD7 (515136) – JOHNCO 7 (514809) near SUNNYSD7 a. Apply fault at the SUNNYSD7 bus. b. Clear fault after 5 cycles and trip the faulted line.
24	FLT24-3PH	3 phase fault on CLAYTON4 138 kV (510919) to SARDIS 4 138 kV (510926), near CLAYTON4. a. Apply fault at the CLAYTON4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
25	FLT25-3PH	3 phase fault on CLAYTON4 138 kV (510919) to NASHOBA4 138 kV (510927), near CLAYTON4. a. Apply fault at the CLAYTON4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
26	FLT26-3PH	3 phase fault on SARDIS 4 138 kV (510926) to ENOWILT4 138 kV (510944), near SARDIS 4. a. Apply fault at the SARDIS 4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
27	FLT27-3PH	3 phase fault on NASHOBA4 138 kV (510927) to BETHEL 4 138 kV (510928), near NASHOBA4. a. Apply fault at the NASHOBA4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
28	FLT28-SB	**Stuck Breaker at LONEOAK4 (510897)** a. Apply single phase fault at LONEOAK4 bus. b. Clear fault after 16 cycles and trip the following elements c. LONEOAK4 (510897) - SMCALTP4 (510906) d. LONEOAK4 (510897) - ENOWILT4 (510944)
29	FLT29-SB	**Stuck Breaker at LONEOAK4 (510897)** a. Apply single phase fault at LONEOAK4 bus. b. Clear fault after 16 cycles and trip the following elements c. LONEOAK4 (510897) - HARTSHN4 (520934) d. LONEOAK4 (510897) - ENOWILT4 (510944)
30	FLT30-SB	**Stuck Breaker at LONEOAK4 (510897)** a. Apply single phase fault at LONEOAK4 bus. b. Clear fault after 16 cycles and trip the following elements c. LONEOAK4 (510897) - ENOWILT4 (510944) d. LONEOAK4 (510897) - CARBON 4 (520844)

Fault Definitions

Cont. No.	Cont. Name	Description
31	FLT31-SB	**Stuck Breaker at BRKN BW4 (505614)** a. Apply single phase fault at BRKN BW4 bus. b. Clear fault after 16 cycles and trip the following elements c. BRKN BW4 (505614) - BETHEL 4 (510928) d. BRKN BW4 (505614) - CRAIGJT4 (510890)
32	FLT32-SB	**Stuck Breaker at BRKN BW4 (505614)** a. Apply single phase fault at BRKN BW4 bus. b. Clear fault after 16 cycles and trip the following elements c. BRKN BW4 (505614) - HOCHTWN4 (520943) d. BRKN BW4 (505614) - BETHEL 4 (510928)
33	FLT33-PO	**Prior Outage of LONEOAK4 (510897) to SMCALTP4 (510906) line;** 3 phase fault on LONEOAK4 (510897) – ENOWILT4 (510944) near LONEOAK4 a. Apply fault at the LONEOAK4 bus. b. Clear fault after 5 cycles and trip the faulted line.
34	FLT34-PO	**Prior Outage of LONEOAK4 (510897) to HARTSHN4 (520934) line;** 3 phase fault on LONEOAK4 (510897) – ENOWILT4 (510944) near LONEOAK4 a. Apply fault at the LONEOAK4 bus. b. Clear fault after 5 cycles and trip the faulted line.
35	FLT35-PO	**Prior Outage of LONEOAK4 (510897) to ENOWILT4 (510944) line;** 3 phase fault on LONEOAK4 (510897) – CARBON 4 (520844) near LONEOAK4 a. Apply fault at the LONEOAK4 bus. b. Clear fault after 5 cycles and trip the faulted line.
36	FLT36-PO	**Prior Outage of BRKN BW4 (505614) to BETHEL 4 (510928) line;** 3 phase fault on BRKN BW4 (505614) - CRAIGJT4 (510890) near BRKN BW4 a. Apply fault at the BRKN BW4 bus. b. Clear fault after 5 cycles and trip the faulted line.
37	FLT37-PO	**Prior Outage of BRKN BW4 (505614) to HOCHTWN4 (520943) line;** 3 phase fault on BRKN BW4 (505614) - BETHEL 4 (510928) near BRKN BW4 a. Apply fault at the BRKN BW4 bus. b. Clear fault after 5 cycles and trip the faulted line.
38	FLT38-3PH	3 phase fault on BROWN 4 138 kV (515157) to COLEMNT4 138 kV (515153), near BROWN 4. a. Apply fault at the BROWN 4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Fault Definitions

Cont. No.	Cont. Name	Description
39	FLT39-3PH	3 phase fault on BROWN 4 138 kV (515157) to S BROWN4 138 kV (505602), near BROWN 4. a. Apply fault at the BROWN 4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
40	FLT40-3PH	3 phase fault on COLEMNT4 138 kV (515153) to BROWNTP4 138 kV (515152), near COLEMNT4. a. Apply fault at the COLEMNT4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
41	FLT41-3PH	3 phase fault on S BROWN4 138 kV (505602) to RUSSETT4 138 kV (521044), near S BROWN4. a. Apply fault at the S BROWN4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
42	FLT42-3PH	3 phase fault on S BROWN4 138 kV (505602) to COLBRTP4 138 kV (515159), near S BROWN4. a. Apply fault at the S BROWN4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
43	FLT43-3PH	3 phase fault on S BROWN4 138 kV (505602) to TUPELO 4 138 kV (505600), near S BROWN4. a. Apply fault at the S BROWN4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
44	FLT44-3PH	3 phase fault on S BROWN4 138 kV (505602) to KRSYJCTS4 138 kV (521109), near S BROWN4. a. Apply fault at the S BROWN4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
45	FLT45-3PH	3 phase fault on S BROWN4 138 kV (505602) to KRSYJCTN4 138 kV (521108), near S BROWN4. a. Apply fault at the S BROWN4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Fault Definitions

Cont. No.	Cont. Name	Description
46	FLT46-SB	**Stuck Breaker at S BROWN4 (505602)** a. Apply single phase fault at S BROWN4 bus. b. Clear fault after 16 cycles and trip the following elements c. S BROWN4 (505602) - COLBRTP4 (515159) d. S BROWN4 (505602) - BROWN 4 (515157)
47	FLT47-SB	**Stuck Breaker at S BROWN4 (505602)** a. Apply single phase fault at S BROWN4 bus. b. Clear fault after 16 cycles and trip the following elements c. S BROWN4 (505602) - KRSYJCTS4 (521109) d. S BROWN4 (505602) - BROWN 4 (515157)
48	FLT48-SB	**Stuck Breaker at S BROWN4 (505602)** a. Apply single phase fault at S BROWN4 bus. b. Clear fault after 16 cycles and trip the following elements c. S BROWN4 (505602) - KRSYJCTN4 (521108) d. S BROWN4 (505602) - BROWN 4 (515157)
49	FLT49-SB	**Stuck Breaker at S BROWN4 (505602)** a. Apply single phase fault at S BROWN4 bus. b. Clear fault after 16 cycles and trip the following elements c. S BROWN4 (505602) - RUSSETT4 (521044) d. S BROWN4 (505602) - BROWN 4 (515157)
50	FLT50-SB	**Stuck Breaker at BROWNTP4 (515152)** a. Apply single phase fault at BROWNTP4 bus. b. Clear fault after 16 cycles and trip the following elements c. BROWNTP4 (515152) - BODLE 4 (515155) d. BROWNTP4 (515152) - COLEMNT4 (515153)
51	FLT51-SB	**Stuck Breaker at BROWNTP4 (515152)** a. Apply single phase fault at BROWNTP4 bus. b. Clear fault after 16 cycles and trip the following elements c. BROWNTP4 (515152) - LTLCITY4 (515151) d. BROWNTP4 (515152) - COLEMNT4 (515153)
52	FLT52-PO	**Prior Outage of S BROWN4 (505602) to COLBRTP4 (515159) line;** 3 phase fault on S BROWN4 (505602) - BROWN 4 (515157) near S BROWN4. a. Apply fault at the S BROWN4 bus. b. Clear fault after 5 cycles and trip the faulted line.
53	FLT53-PO	**Prior Outage of S BROWN4 (505602) to KRSYJCTN4 (521108) line;** 3 phase fault on S BROWN4 (505602) - BROWN 4 (515157) near S BROWN4. a. Apply fault at the S BROWN4 bus. b. Clear fault after 5 cycles and trip the faulted line.

APPENDIX B

SOUTHWEST POWER POOL DISTURBANCE PERFORMANCE REQUIREMENTS (SUBMITTED IN A SEPARATE FILE)

APPENDIX C

DYNAMIC STABILITY PLOTS FOR CLUSTER SCENARIO (SUBMITTED IN SEPARATE FILES FROM APPENDIX C-1 TO C-3)

C-1 Group 14 Cluster Dynamic Stability Plots For 2016 Winter Peak Case

C-2 Group 14 Cluster Dynamic Stability Plots For 2017 Summer Peak Case

C-3 Group 14 Cluster Dynamic Stability Plots For 2025 Summer Peak Case

Each contingency consists of (23) subplots:

- Subplot #1 is the system phase angle channels in the snapshot file provided by SPP.
- Subplot #2 to Subplot #19 are results for (18) generators in the scope of study.
- Subplots #20 to Subplot #21 are voltages at the POI buses in the scope of study.
- Subplots #22 to Subplot #23 are frequencies at the POI buses in the scope of study.

APPENDIX D

DYNAMIC STABILITY PLOTS FOR STAND-ALONE SCENARIO (SUBMITTED IN SEPARATE FILE FROM APPENDIX D-1 TO D-15)

D-1 Group14 StandAlone "GEN-2015-036" Dynamic Stability Plots For 2016 Winter Peak Case
D-2 Group14 StandAlone "GEN-2015-036" Dynamic Stability Plots For 2017 Summer Peak Case
D-3 Group14 StandAlone "GEN-2015-036" Dynamic Stability Plots For 2025 Summer Peak Case
D-4 Group14 StandAlone "GEN-2016-028" Dynamic Stability Plots For 2016 Winter Peak Case
D-5 Group14 StandAlone "GEN-2016-028" Dynamic Stability Plots For 2017 Summer Peak Case
D-6 Group14 StandAlone "GEN-2016-028" Dynamic Stability Plots For 2025 Summer Peak Case
D-7 Group14 StandAlone "GEN-2016-030" Dynamic Stability Plots For 2016 Winter Peak Case
D-8 Group14 StandAlone "GEN-2016-030" Dynamic Stability Plots For 2017 Summer Peak Case
D-9 Group14 StandAlone "GEN-2016-030" Dynamic Stability Plots For 2025 Summer Peak Case
D-10 Group14 StandAlone "GEN-2016-042" Dynamic Stability Plots For 2016 Winter Peak Case
D-11 Group14 StandAlone "GEN-2016-042" Dynamic Stability Plots For 2017 Summer Peak Case
D-12 Group14 StandAlone "GEN-2016-042" Dynamic Stability Plots For 2025 Summer Peak Case
D-13 Group14 StandAlone "GEN-2016-063" Dynamic Stability Plots For 2016 Winter Peak Case
D-14 Group14 StandAlone "GEN-2016-063" Dynamic Stability Plots For 2017 Summer Peak Case
D-15 Group14 StandAlone "GEN-2016-063" Dynamic Stability Plots For 2025 Summer Peak Case

Each contingency consists of (23) subplots:

- Subplot #1 is the system phase angle channels in the snapshot file provided by SPP.
- Subplot #2 to Subplot #19 are results for (18) generators in the scope of study.
- Subplots #20 to Subplot #21 are voltages at the POI buses in the scope of study.
- Subplots #22 to Subplot #23 are frequencies at the POI buses in the scope of study.

EXECUTIVE SUMMARY

Southwest Power Pool (SPP) retained Burns & McDonnell to perform a Definitive Interconnection System Impact Study of the DISIS-2016-001 (Group 15) projects. This study included short circuit analysis, power factor analysis, reactive power analysis and stability analysis to find impacts on the transmission system caused by the interconnections of Group 15 requests which includes a single request GEN-2016-017.

The GEN-2016-017 project is proposed to interconnect within SPP control area. The capacity of the project is 250.7 MW consisting of 109 G.E. 2.3 MW wind turbines as shown in Table ES-1. All analyses were performed using the PTI PSS/E software and the results are summarized below.

Table ES-1: GEN-2016-017 Interconnection Project

Request	Size (MW)	Generator Model	Point of Interconnection
GEN-2016-017	250.7	109 x G.E. 2.3 MW wind	Tap Fort Thompson (652806) – Leland Olds (659105) 345 kV, (G16-017-TAP, 560074)

ES.1 Short Circuit Analysis

The short circuit analysis was performed using the 2017 and 2025 Summer Peak (SP) models. Three-phase fault currents were calculated for the 69 kV and above buses within 5 buses of generator's point of interconnection. The fault current levels were then compared to the fault currents without the generator to determine the impact of the generation interconnection.

The results from short circuit analysis showed that the maximum change in the fault currents in the immediate systems at or near GEN-2016-017 was 27% for both the 2017 summer peak and 2025 summer peak cases. All three-phase current levels with the GEN-2016-017 generator online was below 34,000 A.

ES.2 Power Factor Analysis

The DISIS-2016-001 (Group 15) request, GEN-2016-017, generator was turned off for the power factor analysis. The interconnection generator was replaced with a generator modeled at the high side bus of the collector substation transformer. The replacement generator was modeled to reflect the real power (MW) output of the interconnection request generator and was set to maintain a voltage schedule at the point of interconnection consistent with the voltage schedule in the provided base case or 1.0 pu voltage, whichever was higher. The replacement generator's reactive power capability was set to +/- 9999 MVAr to find the required power factor. The GEN-2016-017 project was analyzed under numerous single element contingencies and the necessary power factor was calculated.

For the contingencies tested, the most leading power factor (generation facility absorbing reactive power from the network) was found to be 0.957 (-76.388 MVAr contribution) in the 2017 summer peak case for the loss of Leland Olds Generator Step-up (GSU) transformer. The most lagging power factor (generating facility providing reactive power to the network) was found to be 0.995 (24.32 MVAr contribution) in the 2020 Winter Peak case for loss of the Leland Olds to GEN-2016-017 Tap transmission line. Per SPP Tariff requirements, the Generating Facilities will be required to meet the standard 95% power factor requirement at the Point of Interconnection. The customer may be required to add capacitor and/or reactor banks depending upon its final collector system design.

ES.3 Reactive Power Analysis

The reactive power analysis was performed for the DISIS-2016-001 (Group 15) request, GEN-2016-017 to determine the reactive power contribution from the project's interconnection line and collector transformer and cables. The goal of the analysis is to size a shunt reactor at the project substation high side bus to reduce POI reactive power value to approximately zero.

The reactive power analysis results showed that the GEN-2016-017 project requires a shunt reactor with 11.5 MVAr at the high side of the project substation is needed to reduce the reactive power transfer at the POI to approximately zero during low/no wind conditions while the generation interconnection project remains connected to the grid.

ES.4 Stability Analysis

The dynamic stability analysis was performed for the DISIS-2016-001 (Group 15) request GEN-2016-017 project. The stability analysis evaluated the system during five load scenarios (2016 winter peak, 2017 summer peak, 2020 winter peak, 2020 summer peak and 2025 summer peak) simulating up to 22 faults that included three-phase and single-line-to-ground faults including faults on prior outage cases and stuck breakers. The stability analysis showed an equally queued project, GEN-2016-044 included in DISIS-2016-001 (Group 16), tripping off-line due to over voltage for a fault event (FLT07-3PH) in 2020 winter peak case and prior queued projects Bison Units 4, 5 and 6 tripping off-line for a fault event (FLT16-3PH) in all five cases due to over voltage. These faults were re-run with the equally or prior queued project's voltage and frequency tripping disabled. There were no machine rotor angle damping or transient voltage recovery violations within the DISIS-2016-001 (Group 15) study for the simulated fault events.

1.0 INTRODUCTION

Burns & McDonnell was retained by Southwest Power Pool (SPP) to perform a Definitive Interconnection System Impact Study of the DISIS-2016-001 (Group 15). This study included short circuit analysis, power factor analysis, reactive power analysis, and stability analysis to find impacts on the transmission system caused by the interconnections of Group 15 requests which includes a single request GEN-2016-017.

GEN-2016-017 project is proposed to interconnect within SPP footprint. The capacity of the project is 250.7 MW consisting of 109 G.E. 2.3 MW wind turbine generators as shown in Table 1-1.

Table 1-1: GEN-2016-017 Interconnection Project

Request	Size (MW)	Generator Model	Point of Interconnection
GEN-2016-017	250.7	109 x G.E. 2.3 MW wind	Tap Fort Thompson (652806) – Leland Olds (659105) 345 kV, (G16-017-TAP, 560074)

1.1 Study Scope

This study is presented in the following seven main parts:

1. Introduction
2. Study Assumptions
3. Short Circuit Analysis
4. Power Factor Analysis
5. Reactive Power Analysis
6. Stability Analysis
7. Conclusions

1.2 Limitations

In the preparation of this report, the information provided to Burns & McDonnell by others was used by Burns & McDonnell to make certain assumptions with respect to conditions which may exist in the future. While Burns & McDonnell believes the assumptions made are reasonable for the purposes of this report, Burns & McDonnell makes no representation that the conditions assumed will, in fact, occur. In addition, while Burns & McDonnell has no reason to believe that the information provided by others, and on which this report is based, is inaccurate in any material respect, Burns & McDonnell has not independently verified such information and cannot guarantee its accuracy or completeness. To the extent that actual future conditions differ from those assumed herein or from the information provided to Burns & McDonnell, the actual results will vary from those presented.

2.0 STUDY ASSUMPTIONS

The short circuit, power factor, reactive power, and stability analyses were performed using the PTI PSS/E software version 32.

2.1 Disturbance Performance Requirement

The following SPP Disturbance Performance Requirements were applied to the Bulk Electric System for the stability analysis. These requirements establish the minimum requirements for machine rotor angle damping and transient voltage recovery.

2.1.1 Rotor Angle Damping Requirement

The machine rotor angles shall exhibit well damped angular oscillations and acceptable power swings following a disturbance on the Bulk Electric System for all NERC events. Well damped angular oscillation is defined as:

1. The Successive Positive Peak Ratio (SPPR) must be less than or equal to 0.95 where SPPR is calculated as:

$$SPPR = \frac{\text{Peak Rotor Angle of 2nd Positive Swing Peak}}{\text{Peak Rotor Angle of 1st Positive Swing Peak}} \leq 0.95$$

Or, Damping Factor % = (1 – SPPR) x 100% ≥ 5%

The machine rotor angle damping ratio may be determined by appropriate modal analysis (i.e. Prony Analysis) where the following equivalent requirement must be met:

Damping Ratio ≥ 0.0081633

2. Successive Positive Peak Ratio Five (SPPR5) must be less than or equal to 0.774 where SPPR5 is calculated as follows:

$$SPPR5 = \frac{\text{Peak Rotor Angle of 5th Positive Swing Peak}}{\text{Peak Rotor Angle of 1st Positive Swing Peak}} \leq 0.774$$

Or, Damping Factor % = (1 – SPPR5) x 100% ≥ 22.6%

The machine rotor angle damping ratio may be determined by appropriate modal analysis (i.e. Prony Analysis) where the following equivalent requirement must be met:

Damping Ratio ≥ 0.0081633.

Burns & McDonnell only calculated these damping values where oscillations were not well damped by the end of the simulation through visual inspection.

2.1.2 Transient Voltage Recovery Requirement:

Any time after a disturbance is cleared; bus voltages on the Bulk Electric System shall not swing outside of the bandwidth of 0.70 per unit to 1.20 per unit. All post-transient voltages must fall between the 0.90 per unit and 1.10 per unit range at the end of simulations. The pre-fault voltages shall be checked to ensure they fall within the 0.90 per unit and 1.10 per unit.

2.2 Study System

The study system consisted of facilities at or above 100 kV within five (5) buses away from the POI. Machines within this study area were monitored for the study.

2.3 Study Models

The short circuit, power factor, reactive power and stability analyses were performed using models developed from the 2015 Southwest Power Pool (SPP) Model Development Working Group (MDWG) PSS/E models. The base cases provided by SPP model the 2016 Winter Peak, 2017 Summer Peak, 2020 Winter Peak, 2020 Summer Peak and 2025 Summer Peak study conditions. The cases were developed with a single interconnection request added to the base case with dispatch adjustments made per SPP's supplied dispatch requirements. Table 2-1 summarizes the study models used for the analyses.

Table 2-1: Study Models for Stability Analysis

3.0 SHORT CIRCUIT ANALYSIS

Burns & McDonnell performed the short circuit analysis to determine the impact of the generation interconnection requests on the fault current levels in the study system. The analysis was performed using version 32 of the PTI PSS/E software. The following sections outline the methodology and results of the analysis.

3.1 Methodology

The short circuit analysis was performed using the 2017 and 2025 Summer Peak models. Three-phase fault currents were calculated for the 69 kV and above buses within 5 buses of generator's point of interconnection. The fault current levels were then compared to the fault currents without the generator to determine the impact of the generation interconnection.

3.2 Short Circuit Analysis Results

Table 3-1 through Table 3-2 summarize the three-phase fault currents observed for facilities two buses away from GEN-2016-017 for the 2017 and 2025 Summer Peak cases, respectively. Details of the fault current for facilities within 5 buses from the generator's point of interconnection is provided in Appendix A.

Table 3-1: 2017 Summer Peak GEN-2016-017 Three-Phase Fault Currents

2	652456	WASHBRN4	230	652	1605	10.395	10.392	0.003	0.03%
2	659108	LOGAN 4	230	652	1628	5.553	5.558	-0.005	-0.10%
2	659109	BASIN 7	115	652	1628	5.543	5.542	0.000	0.01%
2	652532	GR PRAIR	345	652	1604	6.229	6.265	-0.037	-0.58%
2	652832	GRPRAR1-	345	652	1604	6.229	6.265	-0.037	-0.58%

As shown in Table 3-1 and Table 3-2, the maximum fault current increase with the addition of GEN-2016-017 was about 27% in both cases at the point of interconnection.

4.0 POWER FACTOR ANALYSIS

Power factor analysis was performed to determine if the power factor requirement for the interconnection request is within the capabilities of the specified generators.

4.1 Methodology

The DISIS-2016-001 (Group 15) request, GEN-2016-017 generator was turned off for the power factor analysis. The interconnection generator was replaced with a generator modeled at the high side bus of the collector substation transformer. The replacement generator was modeled to reflect the real power (MW) output of the interconnection request generator and was set to maintain a voltage schedule at the point of interconnection consistent with the voltage schedule in the provided base case or 1.0 pu voltage, whichever was higher. The replacement generators' reactive power capability was set to +/- 9999 MVAr to find the required power factor.

4.2 Power Factor Analysis Results

The base case voltages at the POI for the GEN-2016-017 project is provided in Table 4-1.

Table 4-1: Base Case GEN-2016-017 POI Voltages

Machine	PF Capability	POI Bus Number	POI Bus Name	Initial POI Voltage (pu)

For the contingencies tested, the most leading power factor (generation facility absorbing reactive power from the network) was found to be 0.957 (-76.388 MVAr contribution) in the 2017 Summer Peak case for loss of the Leland Olds GSU transformer. The most lagging power factor (generation facility providing reactive power to the network) was found to be 0.995 (24.32 MVAr contribution) in the 2020 Winter Peak case for loss of the Leland Olds to GEN-2016-017 Tap transmission line. Per SPP Tariff requirements, the Generating Facilities will be required to meet the standard 95% power factor requirement at the Point of Interconnection. The customer may be required to add capacitor and/or reactor banks depending upon its final collector system design.

5.0 REACTIVE POWER ANALYSIS

The reactive power analysis was performed for the DISIS-2016-001 (Group 15) request, GEN-2016-017 to determine the reactive power contribution from the project's interconnection line and collector transformer and cables during low/no wind conditions while the project is still connected to the grid. The goal of the analysis is to size shunt reactors at the project substation high side bus to reduce POI reactive power value to approximately zero.

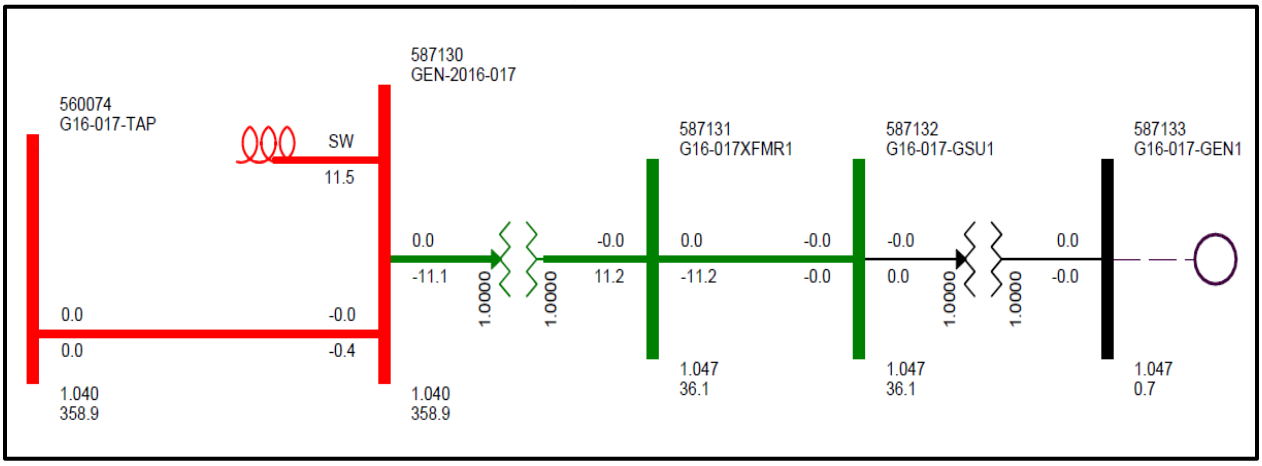
5.1 Methodology

For the GEN-2016-017 project, the generator was switched out of service while other collector system elements remained in-service. Shunt reactor was tested at the study project substation high side bus to bring the MVAr flow into the POI down to approximately zero.

5.2 Reactive Power Analysis Results

The results from the reactive power analysis showed that the GEN-2016-017 project requires approximately 11.5 MVAr shunt reactance at the high side of the project substation, to reduce the POI MVAr to zero. This represents the contributions from the project collector systems. Figure 5-1 illustrates the shunt reactor size required to reduce the POI voltage to approximately zero.

Figure 5-1: GEN-2016-017 Single-line Diagram with Shunt Reactor



6.0 STABILITY ANALYSIS

Burns & McDonnell performed stability analysis to identify impacts on the system stability resulting from the interconnection of DISIS-2016-001 (Group 15) requests.

6.1 Methodology

The Stability Analysis was performed using DISIS-2016-001 (Group 15) study cases. The power flow models and associated dynamics database were initialized (no-fault test) to confirm that there were no errors in the initial conditions of the system and the dynamic data. The dynamics model data for the DISIS-2016-001 (Group 15) request, GEN-2016-017 is provided in Appendix B. The stability analysis was performed using PSS/E version 32.

During the fault simulations, the active power (PELEC), reactive power (QELEC), terminal voltage (ETERM), angle (ANGL) and speed (SPD) were monitored for the GEN-2016-017 generation interconnection request and prior queued projects listed in Table 1-1 and Table 2-2. The study area for the stability analysis is defined as five (5) buses away from the POI of GEN-2016-017. The machine rotor angle for synchronous machines and speed for asynchronous machines within this study area including those within 10 areas, 600 (XEL), 608 (MP), 613 (SMMPA), 615 (GRE), 620 (OTP), 640 (NPPD), 645 (OPPD), 650 (LES), 652 (WAPA) and 661 (MDU) were monitored. In addition, the voltages of all 100 kV and above buses within the study area were monitored.

6.2 Fault Definitions

Burns & McDonnell developed fault description for twenty-two (22) normal clearing, stuck breaker, and prior outage contingency events. All contingency events studied are listed in Table 6-1. These contingencies were applied for the 2016 Winter Peak, 2017 Summer Peak, 2020 Winter Peak, 2020 Summer Peak and the 2025 Summer Peak models.

Table 6-1: Fault Definitions

Fault Name	Contingency (Fault) Description
FLT01-3PH	**3 phase fault on G16-017-TAP (560074) to Fort Thompson (652806) 345 kV Line, CKT 1, near G16-017-TAP Bus**
	a. Apply fault at the G16-017-TAP (560074) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted line and disconnect Fort-Thompson-LNX3 (652806) bus
FLT02-3PH	**3 phase fault on G16-017-TAP (560074) to Leland Olds (659424) 345 kV Line, CKT 1, near G16-017-TAP Bus**
	a. Apply fault at the G16-017-TAP (560074) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted line and disconnect Leland-Olds-LNX3 (659424) bus
FLT03-3PH	**3 phase fault on Fort Thompson (652506) to Fort G16-017-TAP (560074) 345 kV Line, near Fort Thompson Bus**
	a. Apply fault at the Fort Thompson (652506) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted line and disconnect Fort-Thompson-LNX3 (652806) bus

Table 6-1: Fault Definitions (cont.)

Fault Name	Contingency (Fault) Description
FLT04-3PH	**3 phase fault on Fort Thompson (652506) to Grand Prairie (652532) 345 kV Line, near Fort Thompson**
	a. Apply fault at the Fort Thompson (652506) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted line and disconnect Fort-Thompson-LNX3 (652807) and GrandPrairie-LNX3 (652833) bus
FLT05-3PH	**3 phase fault on Fort Thompson 345 kV (652506) to Fort Thompson 230 kV (652507) to Fort Thompson 13.8 kV (652274) XFMR, CKT 1, near Fort Thompson 345 kV**
	a. Apply fault at the Fort Thompson (652506) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted transformer
FLT06-3PH	**3 phase fault on Leland Olds 345 kV (659105) to G16-017-TAP 345 kV (560074), near Leland Olds**
	a. Apply fault at the Leland Olds (659105) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted line and disconnect Leland-Olds-LNX3 (659424) bus
FLT07-3PH	**3 phase fault on Leland Olds 345 kV (659105) to G16-044-TAP 345 kV (560079), near Leland Olds**
	a. Apply fault at the Leland Olds (659105) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted line and disconnect Leland-Olds-LNX3 (659422) bus
FLT08-3PH	**3 phase fault on Leland Olds 345 kV (659105) to Antelop Valley 345 kV (659101) CKT 1, near Leland Olds**
	a. Apply fault at the LELANDO3 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted line
FL09-3PH	**3 phase fault on Leland Olds 345 kV (659105) to Leland Olds 230 kV (659106) to leland Olds 13.8 kV (659201) XFMR, CKT 1, near Leland Olds 345 kV**
	a. Apply fault at the Leland Olds (659105) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted transformer
FLT10-3PH	**3 phase fault on Leland Olds 345 kV (659105) to Leland Olds 20 kV (659111) XFMR, CKT 1, near Leland Olds 345 kV**
	a. Apply fault at the Leland Olds (659105) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted transformer, trip the generator
FLT11-3PH	**3 phase fault on Grand Prairie (652532) to Fort Thompson (652506) 345 kV Line, near Grand Prairie**
	a. Apply fault at the Grand Prarie (652532) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted line and disconnect Grand-Prairie-LNX3 (652833) and Fort-Thompson-LNX3 (652807) bus
FLT12-3PH	**3 phase fault on Grand Prarie (652532) to Holt Co3 (640510) 345 kV Line, near Grand Prarie**
	a. Apply fault at the Grand Prarie (652532) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted line and disconnect Grand-Prairie-LNX3 (652832) bus
FLT13-3PH	**3 phase fault on Grand Prarie (652532) to Grand Prairie Wind (579450) 345 kV Line, CKT 1, near Grand Prarie**
	a. Apply fault at the Grand Prarie (652532) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted line and trip Grand Priaire Wind generators
FLT04-PO1	**Prior Outage of G16-017-TAP (560074) to Leland Olds (659105) 345 kV Line; 3 phase fault on Fort Thompson (652506) to Grand Prairie (652532) 345 kV Line, near Fort Thompson**
	a. Apply fault at the Fort Thompson (652506) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted line and disconnect Fort-Thompson-LNX3 (652807) and GrandPrairie-LNX3 (652833) bus
FLT05-PO1	**Prior Outage of G16-017-TAP (560074) to Leland Olds (659105) 345 kV Line; 3 phase fault on Fort Thompson 345 kV (652506) to Fort Thompson 230 kV (652507) to Fort Thompson 13.8 kV (652274) XFMR, CKT 1, near Fort Thompson 345 kV**
	a. Apply fault at the Fort Thompson (652506) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted transformer

Table 6-1: Fault Definitions (cont.)

Fault Name	Contingency (Fault) Description
FLT07-PO2	**Prior Outage of G16-017-TAP (560074) to Fort Thompson (652506) 345 kV Line; 3 phase fault on Leland Olds 345 kV (659105) to G16-044-TAP 345 kV (560079) CKT 1, near Leland Olds**
	a. Apply fault at the Leland Olds (659105) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted line and disconnect Leland-Olds-LNX3 (659422) bus
FLT08-PO2	**Prior Outage of G16-017-TAP (560074) to Fort Thompson (652506) 345 kV Line; 3 phase fault on Leland Olds 345 kV (659105) to Antelop Valley 345 kV (659101) CKT 1, near Leland Olds**
	a. Apply fault at the Leland Olds (659105) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted line
FL09-PO2	**Prior Outage of G16-017-TAP (560074) to Fort Thompson (652506) 345 kV Line; 3 phase fault on Leland Olds 345 kV (659105) to Leland Olds 230 kV (659106) to leland Olds 13.8 kV (659201) XFMR, CKT 1, near Leland Olds 345 kV**
	a. Apply fault at the Leland Olds (659105) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted transformer
FLT10-PO2	**Prior Outage of G16-017-TAP (560074) to Fort Thompson (652506) 345 kV Line; 3 phase fault on Leland Olds 345 kV (659105) to Leland Olds 20 kV (659111) XFMR, CKT 1, near Leland Olds 345 kV**
	a. Apply fault at the Leland Olds (659105) 345 kV Bus
	b. Clear fault after 6 cycles and trip the faulted transformer, trip the generator
FLT14-SB	**Single Phase Fault with Stuck Breaker at Fort Thompson (652506) 345 kV Bus**
	a. Apply fault at the Fort Thompson (652506) 345 kV Bus
	b. Clear fault after 16 cycles and trip the Following Elements
	2. Fort Thompson to Grand Prarie 345 kV Line
	3. Fort Thompson 345/230/13.8 kV Transformers Trip off only one of these transfomers in addtion to 2 above
FLT15-SB	**Single Phase Fault with Stuck Breaker at leland Olds (659105) 345 kV Bus**
	a. Apply fault at the Leland Olds (659105) 345 kV Bus
	b. Clear fault after 16 cycles and trip the Following Elements
	3. Leland Olds to Antelop Valley 345 kV Lines (CKT 2)
FLT16-3PH	**3 phase fault on Antelope (659101) to Broadland (659120) 345 kV Line, near Antelop**
	a. Apply fault at the Antelop (659101) 345 kV Bus
	b. Clear fault after 6 cycles and disconnect ANTELOP-LNX3 (659420) and BRDLAND-LNX3 (659421)

Single-line-to-ground (SLG) fault impedance values were determined by applying a fault on the base case large enough to produce a 0.6 pu voltage value on the faulted bus. This SLG value was used for the SLG faults in FLT14-SB and FLT15-SB.

6.3 Results

The stability analysis showed an equally queued project, GEN-2016-044 included in DISIS-2016-001 (Group 16), tripping off-line due to over voltage for a fault event (FLT07-3PH) in 2020 winter peak case and prior queued projects Bison Units 4, 5 and 6 tripping off-line for a fault event (FLT16-3PH) in all five cases due to over voltage. These faults were re-run with the equally or prior queued project's voltage and frequency tripping disabled. Table 6-2 summarizes result for the machine rotor angle damping

requirement and transient voltage recovery criteria for all the faults studied. The dynamic stability plots are provided in Appendix C.

7.0 CONCLUSIONS

The purpose of this study was to evaluate the impacts of the DISIS-2016-001 (Group 15) generation interconnection project, GEN-2016-017, on the SPP transmission system. Short circuit analysis, power factor analysis, reactive power analysis and stability analysis were performed for the evaluation.

7.1 Short Circuit Analysis

The results from short circuit analysis showed that the maximum change in the fault currents in the immediate systems at or near GEN-2016-017 was 27% for both the 2017 summer peak and 2025 summer peak cases. All three-phase current levels with the GEN-2016-017 generator online was below 34,000 A.

7.2 Power Factor Analysis

For the contingencies tested, the most leading power factor (generation facility absorbing reactive power from the network) was found to be 0.957 (-76.388 MVAr contribution) in the 2017 SP case for loss of the Leland Olds 345/20 kV GSU transformer. The most lagging power factor (generation facility providing reactive power to the network) was found to be 0.995 (24.32 MVAr contribution) in the 2020 Winter Peak case for loss of the Leland Olds to GEN-2016-017 Tap transmission line. Per SPP Tariff requirements, the Generating Facilities will be required to meet the standard 95% power factor requirement at the Point of Interconnection. The customer may be required to add capacitor and/or reactor banks depending upon its final collector system design.

7.3 Reactive Power Analysis

The reactive power analysis results showed that the GEN-2016-017 project requires a shunt reactor approximately 11.5 MVAr at the high side of the project substation to reduce the reactive power transfer at the POI to approximately zero during low/no wind conditions while the generation interconnection project is remains connected to the grid.

7.4 Stability Analysis

The stability analysis showed equally and prior queued projects tripping off-line for two fault events due to over voltage relay. These faults were re-run with the prior queued project's voltage and frequency tripping disabled. There were no machine rotor angle damping or transient voltage recovery violations within the DISIS-2016-001 (Group 15) study for the simulated fault events.

It should be noted that the results of this study are based on available data and assumptions made at the time of this study. If any of the data and/or assumptions change, the results provided in this report may not apply.

Title: **DISIS-2016-001 (Group 16) Definitive Impact Study: Final Report REP-0045**
Date: February 2017
Author: GianMarco Alian; Engineer I, Power Systems Engineering Dept. *Gianmarco Alian*
Reviewed: Nicholas W. Tenza; Engineer II, Power Systems Engineering Dept. *Nicholas W. Tenza*
Approved: Rajat Majumder; Section Manager, Power Systems Engineering Dept. *Rajat Majumder*

EXECUTIVE SUMMARY

SPP requested a Definitive Interconnection System Impact Study (DISIS). The DISIS required a Stability Analysis, Short-circuit Analysis, Power Factor Analysis, and Low Wind/No Wind Analysis detailing the impacts of the interconnecting projects as shown in Table ES-1.

Table ES-1
Interconnection Projects Evaluated

Request	Size (MW)	Generator Model	Point of Interconnection
GEN-2016-004	202	Suzlon S111 2.1 MW wind	BEPC Leland Olds 230kV (659106)
GEN-2016-044	400	Vestas V110 2.0 MW wind	Tap Groton (659160) - Leland Olds (659105) 345kV, (G16-044-TAP, 560079)
GEN-2016-052	3.3 MW uprate to GI-0508 (total = 52.8 MW)	GE 1.6 MW wind	Hilken 230kV (652466)
GEN-2016-053	3.3 MW uprate to GI-0615 (total = 52.8 MW)	GE 1.6 MW wind	Hilken 230kV (652466)
GEN-2016-065	12.5 MW uprate to GI1414 (total = 156.4MW)	GE 1.8 MW & 1.79MW wind	Daglum 230kV (659448)
GEN-2016-066	12.5 MW uprate to GEN-2015-096 (total = 162.0MW)	GE 2.1 MW & 1.79 MW	Daglum 230kV (659448)

SUMMARY OF STABILITY ANALYSIS

Cluster Scenario

The Stability Analysis determined there were multiple contingencies that resulted in voltage instability and low post-fault voltage recovery when all generation interconnection requests were at 100% output.

To mitigate the voltage instability and low post-fault steady-state voltages, the following upgrades were provided by SPP and implemented in all seasons:

- Daglum to Dickson 230 kV circuit #1
- Groton to G16-044 Tap 345 kV circuit #2
- Emmons County to G16-044 Tap 345 kV circuit #1

After applying the above mitigation, the low post-fault steady-state voltages for the 2016 Winter Peak season were mitigated. However, there were several contingencies in the 2017 Summer Peak and 2025 Summer Peak seasons that still resulted in low post-fault steady-state voltages. The following upgrades were applied to the 2017 Summer Peak case and were applied to the 2025 Summer Peak case if they did not exist:

- Broadland to Split Rock345 kV circuit #1
- MISO MVP Project (exists in 2025 Summer Peak case)

Note that the Broadland to Emmons County 345 kV line reactor near Broadland 345 kV was switched out of service during post-fault steady-state conditions (five seconds after the fault is cleared) to mitigate the low voltages observed at Broadland 345 kV in the 2017 and 2025 Summer Peak cases.

After implementing the above upgrades, the contingency analysis was re-simulated for all contingencies. With the upgrades, the Stability Analysis determined that there was no wind turbine tripping or system instability observed as a result of interconnecting all study projects at 100% output.

Stand-Alone Scenario

For GEN-2016-044, low post-fault steady-state violations were observed for several contingencies for all seasonal peak conditions examined. The following upgrades were implemented to mitigate the low voltages observed:

- Daglum to Dickson 230 kV circuit #1 (16WP, 25SP)

- Groton to G16-044 Tap 345 kV circuit #2 (16WP, 25SP)
- Emmons County to G16-044 Tap 345 kV circuit #1 (16WP, 25SP)
- Broadland to Split Rock 345 kV circuit #1(17SP)
- MISO MVP Project (17SP)

After implementing these changes, observed voltage violations were mitigated.

For GEN-2016-065 and GEN-2016-66, voltage instability was observed for all seasonal peak conditions examined. The following upgrades were implemented to mitigate the low voltages observed:

- Daglum to Dickson 230 kV circuit #1 (All seasons)

After implementing the above line upgrade in all seasons, observed voltage violations were mitigated.

SUMMARY OF THE SHORT-CIRCUIT ANALYSIS

The Short-Circuit Analysis was performed on the 2017 Summer Peak and 2025 Summer Peak power flows for all study projects. Refer to Table ES-2 for a list of maximum fault currents observed for each study project for the 2017 Summer Peak case. Refer to Table ES-3 for a list of maximum fault currents observed for each study project for the 2025 Summer Peak case.

Table ES-2
List of Maximum Fault Currents Observed for Each Study Project for the 2017 Summer Peak Case

Study Project	POI Name	Fault Current at POI (kA)	Maximum Fault Current (kA)	Fault Location	Bus Voltage (kV)
GEN-2016-004	BEPC Leland Olds 230kV (659106)	23.75	52.77	COON CK7	115
GEN-2016-044	Tap Groton (659160) - Leland Olds (659105) 345kV, (G16-044-TAP, 560079)	8.06	24.22	RAUN 3	345
GEN-2016-052	Hilken 230kV (652466)	8.71	23.75	LELANDO4	230
GEN-2016-053	Hilken 230kV (652466)	8.71	23.75	LELANDO4	230
GEN-2016-065	Daglum 230kV (659448)	7.33	20.03	CENTER 4	230
GEN-2016-066	Daglum 230kV (659448)	7.33	20.03	CENTER 4	230

Table ES-3
List of Maximum Fault Currents Observed for Each Study Project for the 2025 Summer Peak Case

Study Project	POI Name	Fault Current at POI (kA)	Maximum Fault Current (kA)	Fault Location	Bus Voltage (kV)
GEN-2016-004	BEPC Leland Olds 230kV (659106)	23.91	52.94	COON CK7	115
GEN-2016-044	Tap Groton (659160) - Leland Olds (659105) 345kV, (G16-044-TAP, 560079)	8.28	24.73	RAUN 3	345
GEN-2016-052	Hilken 230kV (652466)	8.79	23.91	LELANDO4	230
GEN-2016-053	Hilken 230kV (652466)	8.79	23.91	LELANDO4	230
GEN-2016-065	Daglum 230kV (659448)	7.35	20.38	HESKETT 7	115
GEN-2016-066	Daglum 230kV (659448)	7.35	20.38	HESKETT 7	115

SUMMARY OF POWER FACTOR ANALYSIS

The upgrades identified in the Stability Analysis were implemented in the power flow cases and utilized for the Power Factor Analysis. Refer to Table ES-4 for the power factor analysis results for each study generator. The table lists the range of power factor required for each study project.

Table ES-4
Power Factor Analysis Summary for Study Projects

Study Project	Power Factor Range for Each Study Project[1]					
	16WP		17SP		25SP	
GEN-2016-004	-0.987	0.995	-0.910	-0.999	-0.920	1.000
GEN-2016-044	-0.987	0.997	-0.850	-0.941	-0.889	-0.952
GEN-2016-052	-0.987	0.988	-0.960	0.991	-0.913	0.997
GEN-2016-053	-0.987	0.988	-0.960	0.991	-0.913	0.997
GEN-2016-065	0.997	1.000	0.998	1.000	0.998	1.000
GEN-2016-066	0.997	1.000	0.998	1.000	0.998	1.000

[1]Lagging power factors are negative and leading power factors are positive

SUMMARY OF THE LOW/NO WIND/SOLAR IRRADIANCE ANALYSIS

The amount of reactive power injected into the transmission network was recorded at the high side of the transformer near the point of interconnection for all study projects for each season. The maximum reactance needed for zero Mvar flow was -39.35 Mvar for GEN-2016-065. The minimum reactance needed for zero Mvar flow was -4.50 Mvar for GEN-2016-052 and GEN-2016-053.

SECTION 1: OBJECTIVES

The objective of this report is to provide Southwest Power Pool, Inc. (SPP) with the deliverables for the DISIS-2016-001 (Group 16) Definitive Impact Study. SPP requested an Interconnection System Impact Study for six (6) generation interconnections for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak, which requires a Stability Analysis, Short-circuit Analysis, Power Factor Analysis, Low/No Wind/Solar Irradiance Analysis, and an Impact Study Report.

SECTION 2: BACKGROUND

The Siemens Power Technologies International PSS/E power system simulation program Version 32.2.0 was used for this study. SPP provided the stability database cases for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and a list of contingencies to be examined. The model includes the study projects shown in Table 2-1 and the previously queued projects listed in Table 2-2. Refer to Appendix A for the steady-state and dynamic model data for the study projects. A power flow one-line diagram for each generation interconnection project is shown in Figures 2-1 through 2-4. Note that the one-line diagrams represent the 2016 Winter Peak case.

The Stability Analysis determined the impacts of the new interconnecting projects on the stability and voltage recovery of the nearby system and the ability of the interconnecting projects to meet FERC Order 661A. If problems with stability or voltage recovery are identified, the need for reactive compensation or system upgrades will be investigated. Three-phase faults and single line-to-ground faults will be examined as listed in Table 2-3. Note that all contingencies listed were examined for the Cluster Scenario, and specified contingencies (indicated by an X) were examined for each Stand Alone generator.

A Short-Circuit Analysis was performed on the 2017 Summer Peak and 2025 Summer Peak study years for each study generator. The study was performed five buses out from the study generator's point of interconnection and results were documented.

The Power Factor Analysis determined the power factor at the high side of the transformer near the point of interconnection for the wind or solar interconnection projects for pre-contingency and post-contingency conditions. The N-1, three phase contingencies listed in Table 2-3 were used in the Power Factor analysis.

The Summary of the Low/No Wind/Solar Irradiance Analysis was completed for all wind and solar farm interconnections. This analysis determined if reactive support is needed to have a Mvar flow of approximately zero at the point of interconnection (POI).

SECTION 3: STABILITY ANALYSIS

The objective of the Stability Analysis was to determine the impacts of the generator interconnections on the stability and voltage recovery on the SPP transmission system. If problems with stability or voltage recovery were identified, the need for reactive compensation or system upgrades was investigated.

3.1 Approach

SPP provided MEPPI with the following three power flow cases:

- MDWG15-16WP_DIS1601_G16
- MDWG15-17SP_DIS1601_G16
- MDWG15-25SP_DIS1601_G16

Each case was examined prior to the Stability Analysis to ensure the case contained the proposed study projects and any previously queued projects listed in Tables 2-1 and 2-2 respectively. There was no suspect power flow data in the study area. The dynamic datasets were also verified and stable initial system conditions (i.e., “flat lines”) were achieved. Three-phase and single phase-to-ground faults listed in Table 2-3 were examined. Single-phase fault impedances were calculated for each season to result in a voltage of approximately 60% of the pre-fault voltage. Refer to Table 3-1 for a list of the calculated single-phase fault impedances. Refer to Tables 3-2 through 3-5 for the calculated single-phase fault impedances for the Stand Alone scenarios.

Table 3-1
Calculated Single-Phase Fault Impedances

[1]Ref. No.	Cont. Name	Single-Phase Fault Impedance (MVA)		
		2016 Winter	2017 Summer	2025 Summer
1	FLT12-SB	-6062.5	-5656.3	-6062.5
2	FLT13-SB	-6062.5	-5656.3	-6062.5
3	FLT14-SB	-6062.5	-5656.3	-6062.5

7	FLT74-SB	-1125.0	-1125.0	-1125.0
8	FLT75-SB	-1125.0	-1125.0	-1125.0
9	FLT76-SB	-1125.0	-1125.0	-1125.0

(1) Refer to Table 2-3 for a description of the contingency scenario

Bus voltages, machine rotor angles, and previously queued generation in the study area were monitored in addition to bus voltages and machine rotor angles in the following areas:

- 640 NPPD
- 645 OPPD
- 650 LES
- 652 WAPA
- 600 XEL
- 608 MP
- 613 SMMPA
- 615 GRE

- 620 OTP
- 661 MDU

Requested and previously queued generation outside the above study area was also monitored.

The results of the analysis determined if reactive compensation or system upgrades were required to obtain acceptable system performance. If additional reactive compensation was required, the size, type, and location were determined. The proposed reactive reinforcements would ensure the wind or solar farm meets FERC Order 661A low voltage requirements and return the wind or solar farm to its pre-disturbance operating voltage. If the results indicated the need for fast responding reactive support, dynamic support such as an SVC or STATCOM was investigated. If tripping of the prior queued projects was observed during the stability analysis (for under/over voltage or under/over frequency) the simulations were re-simulated with the prior queued project's voltage and frequency tripping disabled.

3.2 Cluster Scenario Stability Analysis Results

The Stability Analysis determined there were no contingencies that resulted in system instability or generation tripping offline for the examined seasonal peak conditions when all generation interconnection requests were at 100% output.

However, voltage violations were observed for the Cluster Scenario for the 2016 Winter Peak case. Contingencies FLT21-3PH, FLT22-3PH, and LT60-3PH, FLT68-SB, FLT70-SB were observed to have overvoltage and undervoltage violations, respectively. After discussion with SPP, it was determined that a line from Daglum (659448) to Dickson (652417) 230 kV circuit #1, G16-044-TAP (560079) to Groton (659160) 345 kV circuit #2, and G16-044-TAP (560079) to Emmons County (561001) 345 kV circuit #1 should be implemented in the 2016 Winter Peak case. After implementing these changes, the voltage violations that were observed were mitigated.

For the 2017 and 2025 Summer Peak case, voltage instability was observed for several contingencies. The addition of the new lines from Daglum (659448) to Dickson (652417) 230 kV circuit #1, G16-044-TAP (560079) to Groton (659160) 345 kV circuit #2, and G16-044-TAP (560079) to Emmons County (561001) 345 kV circuit #1 helped mitigate all but five contingencies.

Contingencies FLT23-3PH, FLT24-3PH, FLT26-3PH, FLT29-PO and FLT31-PO were observed to have post-contingency voltages below 0.9 p.u. After discussion with SPP, a line from Split Rock (601006) to Broadland (659120) 345 kV circuit #1 is required to be implemented. Additionally, the MISO MVP Project was added only for the 2017 Summer Peak case. Note that the Broadland to Emmons County 345 kV line reactor near Broadland 345 kV was switched out

of service during post-fault steady-state conditions (five seconds after the fault is cleared) to mitigate the low voltages observed at Broadland 345 kV in the 2017 and 2025 Summer Peak cases.

After implementing these changes, observed voltage violations were mitigated. Plots of the bus voltages observed for the five cases with and without system upgrades are shown in Figures 3-1 through 3-5.

Refer to Table 3-6 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3. Table 3-6 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline, if acceptable voltage recovery was observed after the fault was cleared, and if the voltage recovered to above 0.9 p.u. and below 1.1 p.u. post fault steady-state conditions. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady-state voltage (for N-1 contingencies) at the pre-contingent level or at least above 0.9 p.u. and below 1.1. p.u.

Refer to Appendix B, Appendix C, and Appendix D for a complete set of plots for all contingencies for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions, respectively.

3.3 Stand Alone Scenario Stability Analysis Results: GEN-2016-004

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability or generation tripping offline for all examined seasonal peak conditions when GEN-2016-004 was interconnected at 100% output. However, four contingencies (FLT06-3PH, FLT07-3PH, FLT08-3PH and FLT10-3PH) resulted in final voltages exceeding 1.1 p.u. at the ROSEAUN2 500kV bus (601012) for 2017 Summer Peak case. After discussion with SPP, it was determined that this was a pre-existing issue.

Refer to Table 3-8 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-004 Stand Alone Analysis. Table 3-8 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

Refer to Appendix E, Appendix F, and Appendix G for a complete set of plots for all Stand Alone Scenario contingencies for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions, respectively.

(1) Final voltage at ROSNEAUN2 500kV exceeded 1.1 p.u. However, this was determined to be a pre-existing condition.

3.4 Stand Alone Scenario Stability Analysis Results: GEN-2016-044

The Stand Alone Scenario Stability Analysis determined that there were several contingencies that resulted in voltage violations for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak when GEN-2016-044 was interconnected at 100% output.

Refer to Table 3-9 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-044 Stand Alone Analysis. Table 3-9 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

It was determined that the following upgrades were required to mitigate the violations observed for all examined seasonal peak conditions:

- Daglum to Dickson 230 kV circuit #1
- G16-044-TAP to Groton 345 kV circuit #2
- G16-044-TAP to Emmons County 345 kV circuit #1
- Broadland to Split Rock 345 kV circuit #1 (2017 Summer Peak only)
- MISO MVP Project (Big Stone 345 kV) (2017 Summer Peak only)

After the above upgrades were implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria. Figure 3-6 is a plot of bus voltages for FLT24-3PH with and without system upgrades.

3.5 Stand Alone Scenario Stability Analysis Results: GEN-2016-052

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability or generation tripping offline for all examined seasonal peak conditions when GEN-2016-052 was interconnected at 100% output. However, several contingencies resulted in final voltages exceeding 1.1 p.u. at the ROSEAUN2 500kV bus (601012) for 2017 Summer Peak. After discussion with SPP, it was determined that this was a pre-existing issue.

Refer to Table 3-10 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-052 Stand Alone Analysis. Table 3-10 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

(1) Final voltage at ROSNEAUN2 500kV exceeded 1.1 p.u. However, this was determined to be a pre-existing condition.

3.6 Stand Alone Scenario Stability Analysis Results: GEN-2016-053

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability or generation tripping offline for all examined seasonal peak conditions when GEN-2016-053 was interconnected at 100% output. However, several contingencies resulted in final voltages exceeding 1.1 p.u. at the ROSEAUN2 500kV bus (601012) for 2017 Summer Peak. After discussion with SPP, it was determined that this was a pre-existing issue.

Refer to Table 3-11 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-053 Stand Alone Analysis. Table 3-11 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

(1) Final voltage at ROSNEAUN2 500kV exceeded 1.1 p.u. However, this was determined to be a pre-existing condition.

3.7 Stand Alone Scenario Stability Analysis Results: GEN-2016-065

The Stand Alone Scenario Stability Analysis determined that contingencies FLT81-PO, FLT82-PO and FLT83-PO resulted in voltage instability for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak when GEN-2016-065 was interconnected at 100% output.

Refer to Table 3-12 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-065 Stand Alone Analysis. Table 3-12 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

It was determined that the following upgrade was required to mitigate the violations observed for all examined seasonal peak conditions:

- Daglum to Dickson 230 kV circuit #1

After the above upgrade was implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria. Figure 3-7 is a plot of bus voltages for FLT82-3PH-PO with and without system upgrades.

3.8 Stand Alone Scenario Stability Analysis Results: GEN-2016-066

The Stand Alone Scenario Stability Analysis determined that contingencies FLT81-PO, FLT82-PO and FLT83-PO resulted in voltage instability for 2017 Summer Peak, and 2025 Summer Peak when GEN-2016-066 was interconnected at 100% output.

Refer to Table 3-13 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-066 Stand Alone Analysis. Table 3-13 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

It was determined that the following upgrade was required to mitigate the violations observed for all examined seasonal peak conditions:

- Daglum to Dickson 230 kV circuit #1 (2017 and 2025 Summer Peak only)

After the above upgrade was implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria. Figure 3-8 is a plot of bus voltages for FLT82-3PH-PO with and without system upgrades.

SECTION 4: SHORT-CIRCUIT ANALYSIS

The objective of this task is to quantify the three-phase to ground fault currents for the 2017 and 2025 Summer Peak season for each interconnecting generator.

4.1 Approach

The Short-Circuit analysis will assess breaker adequacy and fault duties for the generator interconnection bus and five buses away from the point of interconnection. MEPPI will assume no outages to find maximum short-circuit currents that flow through the breaker. The Automatic Sequencing Fault Calculation (ASCC) function in PSS/E was utilized to perform this task. FLAT conditions were applied to pre-fault conditions and the following adjustments were utilized:

- All synchronous and asynchronous machine P and Q output was set to zero
- All transformer tap ratios were set to 1.0 p.u. and all phase shift angles were set to zero
- All generator reactance's were fixed to the subtransient reactance
- All line charging was set to zero
- All shunts were set to zero
- All loads were set to zero
- All pre-fault bus voltages were set to 1.0 p.u. and a phase shift angle of zero

4.2 Short-Circuit Results: 2017 Summer Peak

The maximum fault current for each bus is provided for the 2017 Summer Peak conditions. The following tables show the short circuit results for the study generators for the 2017 Summer Peak condition:

- Table 4-1: Short-circuit Analysis for GEN-2016-004
- Table 4-2: Short-circuit Analysis for GEN-2016-044
- Table 4-3: Short-circuit Analysis for GEN-2016-052 and GEN-2016-053
- Table 4-4: Short-circuit Analysis for GEN-2016-065 and GEN-2016-066

4.3 Short-Circuit Results: 2025 Summer Peak

The maximum fault current for each bus is provided for the 2025 Summer Peak conditions. The following tables show the short circuit results for the study generators for the 2025 Summer Peak conditions:

- Table 4-5: Short-circuit Analysis for GEN-2016-004
- Table 4-6: Short-circuit Analysis for GEN-2016-044
- Table 4-7: Short-circuit Analysis for GEN-2016-052 and GEN-2016-053
- Table 4-8: Short-circuit Analysis for GEN-2016-065 and GEN-2016-066

SECTION 5: POWER FACTOR ANALYSIS

The objective of this task is to quantify the power factor at the point of interconnection for the wind farms during base case and system contingencies. SPP transmission planning practice requires interconnecting generation projects to maintain the power factor (pf) at the Point of Interconnection (POI) within +/- 0.95 pf for system intact conditions and for post-contingency conditions. This is analyzed by having the wind/solar farm maintain a prescribed voltage schedule at the point of interconnection of 1.0 p.u. voltage or higher.

The 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak power flows provided by SPP were examined prior to the Power Factor Analysis to ensure they contained the proposed study project modeled at 100% of the nameplate rating and any previously queued projects listed in Table 2-2. There was no suspect power flow data in the study area. The proposed study project and any previously queued projects at the same point of interconnection were turned off during the power factor analysis. The wind farm(s) were then replaced by a generator modeled at the high side bus with the same real power (MW) capability as the wind farm(s) and open limits for the reactive power set points (Mvar). The generator was set to hold the POI scheduled bus voltage. All N-1, three-phase fault contingencies from Table 2-3 were then applied and the reactive power required to maintain the bus voltage was recorded.

5.1 Approach

The upgrades that were identified in the Stability Analysis were implemented to each power case for the power factor analysis. Refer to Section 3 for the necessary upgrades and Table 5-1 for the scheduled voltage each study generator was set to hold at the point of interconnection for each season.

GEN-2016-004 and Lelando Generation (659110) were disabled in the power flow case. A generator was placed at the high side bus of GEN-2016-004 and modeled with PGEN = 201.6 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. A second generator was placed at the high side bus of the Lelando Generation and was modeled with PGEN = 170.6 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar for the 2016 Winter Peak case. For the 2017 Summer Peak case, PGEN = 144.54 MW and for the 2025 Summer Peak case, PGEN = 206.6 MW. All buses and transformers connected from the high side bus of each project to the corresponding generator were disabled.

GEN-2016-044 was disabled and a generator was placed at the study project's high side bus. The generator was modeled with PGEN = 400.0 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the study project's high side bus to GEN-2016-044 were disabled.

GEN-2016-052, GEN-2016-053, GI-0715, and GI-0727 were all disabled in the power flow case. Since GEN-2016-052 and GEN-2016-053 share the same step-up transformer, two generators were placed at the shared high side bus of GEN-2016-052 and GEN-2016-053. Both generators were modeled with PGEN = 52.8 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. Similarly, GI-0715 and GI-0727 share the same step-up transformer and thus, two generators were placed at the shared high side bus of GI-0715 and GI-0727. Both generators were modeled with PGEN = 99 MW, Qmin = -9999 Mvar, Qmax = 9999 Mvar. All buses and transformers connected from the project's high side bus to the corresponding generator were disabled. Note the Power Factor Analysis was performed separately for GEN-2016-052 and GEN-2016-053.

GEN-2016-065, GEN-2016-066, and GEN-2015-091 all share the same point of interconnection, Daglum 230 kV, and were all disabled in the power flow case. A generator was placed at the high side bus of GEN-2016-065 and modeled with PGEN = 156.5 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. A second generator was placed at the high side bus of GEN-2016-066 and modeled with PGEN = 162.0 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. A third generator was placed at the high side bus of GEN-2015-091 and modeled with PGEN = 101.2 MW, QMin = -9999 Mvar, and QMax = 9999 Mvar. All buses and transformers connected from the high side bus of each project to the corresponding generator were disabled. Note the Power Factor Analysis was performed separately for GEN-2016-065 and GEN-2016-066.

Table 5-1
Voltage Schedule of All Study Generators for All Seasons

Point of Interconnection Voltage (p.u.)				
Request	**POI**	**16WP**	**17SP**	**25SP**
GEN-2016-004	BEPC Leland Olds 230kV (659106)	1.011	1.000	1.000
GEN-2016-044	Tap Groton (659160) - Leland Olds (659105) 345kV, (G16-044-TAP, 560079)	1.001	1.000	1.000
GEN-2016-052	Hilken 230kV (652466)	1.016	1.009	1.012

5.2 Power Factor Analysis Results

The power factor was calculated for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions. The following tables show the power factor results for the study generators:

- Table 5-1: Power Factor Analysis for GEN-2016-004
- Table 5-2: Power Factor Analysis for GEN-2016-044
- Table 5-3: Power Factor Analysis for GEN-2016-052
- Table 5-4: Power Factor Analysis for GEN-2016-053
- Table 5-5: Power Factor Analysis for GEN-2016-065
- Table 5-6: Power Factor Analysis for GEN-2016-066

Note that a positive Q (Mvar) output illustrates that the generator is absorbing reactive power from the system, implying a leading power factor; a negative Q (Mvar) illustrates that the generator is supplying reactive power to the system, implying a lagging power factor.

Table 5-1
Power Factor Analysis: GEN-2015-053

Cont. No.	Case	2016 Winter Peak			2017 Summer Peak			2025 Summer Peak

Study Generator GEN-2016-066

The Power Factor Analysis shows that GEN-2016-066 has a power factor range of 0.997 leading to unity for the 2016 Winter Peak conditions, a power factor range of 0.998 leading to unity for the 2017 Summer Peak conditions, and a power factor range of 0.998 leading to unity for the 2025 Summer Peak conditions.

SECTION 6: LOW/NO WIND/SOLAR IRRADIANCE ANALYSIS

The objective of this task is to determine the impact of low/no wind conditions on wind farms or low/no solar irradiance on solar farms. The 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak power flows provided by SPP were examined for this analysis.

6.1 Approach

Low/no wind and low/no solar irradiance were examined for all wind farms and solar farms, respectively. Generators were disabled (independently), but the collector systems remained in-service. In order to maintain generation and load balance in the SPP area, the generation was scaled after disabling the respective generator. The amount of reactive power injected into the transmission network was recorded at the respective point of interconnection. This reactive power comes from the capacitance of the project's transmission lines and collector cables. A shunt reactor was added at the high side bus to bring the Mvar flow into the POI down to approximately zero.

6.2 Low/No Wind and Low/No Solar Irradiance Analysis

The reactance needed to bring the Mvar flow into the point of interconnect to zero Mvar was recorded for each season for all wind or solar farms. Refer to Table 6-1 for the Low/No Wind/Solar Irradiance Analysis results. The table lists the generators examined and the amount of reactive power needed for zero Mvar flow into the POI for each season.

Table 6-1
Low/No Wind/Solar Irradiance Analysis Results

Request	Size (MW)	POI Name	2016 WP	2017 SP	2025 SP
GEN-2016-004	202	BEPC Leland Olds 230kV (659106)	13.60	13.60	13.60

SECTION 7: CONCLUSIONS

Summary of Stability Analysis

Cluster Scenario

The Stability Analysis determined there were multiple contingencies that resulted in voltage instability and low post-fault voltage recovery when all generation interconnection requests were at 100% output.

To mitigate the voltage instability and low post-fault steady-state voltages, the following upgrades were provided by SPP and implemented in all seasons:

- Daglum to Dickson 230 kV circuit #1
- Groton to G16-044 Tap 345 kV circuit #2
- Emmons County to G16-044 Tap 345 kV circuit #1

After applying the above mitigation, the low post-fault steady-state voltages for the 2016 Winter Peak season were mitigated. However, there were several contingencies in the 2017 Summer Peak and 2025 Summer Peak seasons that still resulted in low post-fault steady-state voltages. The following upgrades were applied to the 2017 Summer Peak case and were applied to the 2025 Summer Peak case if they did not exist:

- Broadland to Split Rock 345 kV circuit #1
- MISO MVP Project (exists in 2025 Summer Peak case)

Note that the Broadland to Emmons County 345 kV line reactor near Broadland 345 kV was switched out of service during post-fault steady-state conditions (five seconds after the fault is cleared) to mitigate the low voltages observed at Broadland 345 kV in the 2017 and 2025 Summer Peak cases.

After implementing the above upgrades, the contingency analysis was re-simulated for all contingencies. With the upgrades, the Stability Analysis determined that there was no wind turbine tripping or system instability observed as a result of interconnecting all study projects at 100% output.

Stand-Alone Scenario

For GEN-2016-044, low post-fault steady-state violations were observed for several contingencies for all seasonal peak conditions examined. The following upgrades were implemented to mitigate the low voltages observed:

- Daglum to Dickson 230 kV circuit #1 (16WP, 25SP)
- Groton to G16-044 Tap 345 kV circuit #2 (16WP, 25SP)
- Emmons County to G16-044 Tap 345 kV circuit #1 (16WP, 25SP)
- Broadland to Split Rock 345 kV circuit #1(17SP)
- MISO MVP Project (17SP)

After implementing these changes, the voltage violations that were observed were mitigated.

For GEN-2016-065 and GEN-2016-066, voltage instability was observed for all seasonal peak conditions examined. The following upgrades were implemented to mitigate the low voltages observed:

- Daglum to Dickson 230 kV circuit #1 (All seasons)

After implementing the above line upgrade in all seasons, the voltage violations that were observed were mitigated.

Summary of the Short-Circuit Analysis

The Short-Circuit Analysis was performed on the 2017 Summer Peak and 2025 Summer Peak power flows for all study projects. Refer to Table 7-1 for a list of maximum fault currents observed for each study project for the 2017 Summer Peak case. Refer to Table 7-2 for a list of maximum fault currents observed for each study project for the 2025 Summer Peak case.

Table 7-1
List of Maximum Fault Currents Observed for Each Study Project for the 2017 Summer Peak Case

Study Project	POI Name	Fault Current at POI (kA)	Maximum Fault Current (kA)	Fault Location	Bus Voltage (kV)
GEN-2016-004	BEPC Leland Olds 230kV (659106)	23.75	52.77	COON CK7	115
GEN-2016-044	Tap Groton (659160) - Leland Olds (659105) 345kV, (G16-044-TAP, 560079)	8.06	24.22	RAUN 3	345

GEN-2016-066	0.997	1.000	0.998	1.000	0.998	1.000

[1]Lagging power factors are negative and leading power factors are positive

Summary of the Low/No Wind/Solar Irradiance Analysis

The amount of reactive power injected into the transmission network was recorded at the high side of the transformer near the point of interconnection for all study projects for each season. The maximum reactance needed for zero Mvar flow was -39.35 Mvar for GEN-2016-065. The minimum reactance needed for zero Mvar flow was -4.50 Mvar for GEN-2016-052 and GEN-2016-053.

SUMMARY

Southwest Power Pool (SPP) has commissioned ABB Inc., to perform a System Impact Study for interconnection request DISIS-2016-001 (Group 17) which includes generation interconnection requests GEN-2015-089 (200 MW wind farm connected to 230 kV Utica Junction) and GEN-2016-054 (54.4 MW wind farm connected at 230kV Wessington Springs).

The objective of this study is to evaluate the collective as well as individual impact of the three projects on the existing and future planning system. The study is performed on three system scenarios provided by SPP:

- 2016 Winter Peak Case
- 2017 Summer Peak Case
- 2025 Summer Peak Case

All the simulation results showed no stability problems and no voltage violations for all three seasons. All the simulation results were summarized in Table 2-2 and Table 2-3. Also, for the contingencies simulated GEN-2015-089 and GEN-2016-054 remained on line and, therefore, will comply with FERC Order 661A low voltage ride-through.

System short-circuit current levels at up to five buses away from the point of interconnection were calculated and tabulated for SPP's reference.

Power Factor Analysis was performed to ensure the studied project meets FERC and SPP power factor requirements for wind farm interconnections. Table 4-1 summarizes the power factor analysis results. The detailed power factor analysis results for each studied contingency are provided in Appendix C. Per SPP and FERC requirements, the generating facility shall be designed to meet the requirement of 95% lagging (providing vars) and 95% leading (absorbing vars) to the Point of Interconnection.

The Low/No Wind analysis shows that a 29.98 MVAr / 2.15 MVAr shunt reactors are required to bring the MVAr flows at two POIs down to approximate zero under low/no wind conditions for GEN-2015-089 and GEN-2016-054 respectively. The reactor bank size is approximate and the final size will be determined in the final facility and collector system design.

The results of this analysis are based on available data and assumptions made at the time of conducting this study. If any of the data and/or assumptions made in developing the study model change, the results provided in this report may not apply.

1 Introduction

Southwest Power Pool (SPP) has commissioned ABB Inc., to perform a System Impact Study for DISIS-2016-001 (Group 17) which includes generation interconnection requests GEN-2015-089 (200 MW wind farm connected to 230 kV Utica Junction) and GEN-2016-054 (54.4 MW wind farm connected at 230kV Wessington Springs) as shown in Table 1-1.

Table 1-1 Group 17 Generation Interconnection Requests

Request	Size (MW)	Generator Model	Point of Interconnection
GEN-2015-089	200	GE 2.0MW wind	WAPA Utica Junction 230kV (652526)
GEN-2016-054	3.4 uprate (total = 54.4MW)	GE 1.6MW wind	Wessington Springs 230kV (652607)

The objective of this study is to evaluate the impact of projects GEN-2015-089 and GEN-2016-054 on the existing and future planning system. The study is performed on three system scenarios provided by SPP:

- 2016 Winter Peak Case
- 2017 Summer Peak Case
- 2025 Summer Peak Case

SPP provided the study cases for all three system scenarios with the three projects included. One line diagrams of the local area for all three seasons are shown in Figure 1-1. The studied generator is circled red.

Three system scenarios supplied by SPP included the following prior queued projects for Group 17:

Table 1-2 Group 17 Prior Queued Projects

Request	Size (MW)	Generator Model	Point of Interconnection
GEN-2006-002IS	51	wind	Wessington Springs 230kV (652607)
GEN-2009-006IS	90	wind	Mission 115kV (652482)
GEN-2009-007IS	100	wind	Mission 115kV (652482)
GEN-2009-020AIS	130.5	wind	Trip Junction 115kV (660055)
GEN-2012-009IS	99	wind	Fort Randall 115kV (6525510)

2 Study Methodology

In this study, ABB investigated the stability of the system for faults in the vicinity of the proposed plant as defined by SPP. The studied faults involve three-phase transformer faults with normal clearing, three-phase line faults with normal clearing, and single-line-to-ground (SLG) faults with stuck breaker.

2.1 Stability Analysis Methodology

Stability analysis is performed to determine whether the electric system would meet stability criteria following the addition of projects: GEN-2015-089 and GEN-2016-054.

Stability analysis was performed using Siemens-PTI's PSS/E dynamics program V32.2.0.

All the faults listed in Table 2-1 were simulated for 20 seconds.

Table 2-1: List of Faults of Stability Analysis

Single-line-to-ground faults were simulated with the standard method of applying fault impedance to the positive sequence network to represent the effect of the negative and zero sequence networks on the positive sequence network. The SLG fault impedance was computed by assuming a positive sequence voltage at the fault location at approximately 60% of pre-fault voltage, which is a typical value.

The Southwest Pool Disturbance Performance Criteria Requirements in Appendix A were used to evaluate the system response during the initial transient period following a disturbance on the system. Generator response and bus voltages (115 kV and above) in Areas 330, 356, 600, 615, 620, 635, 640, 645, 652 and 661 were monitored to ensure the system performance meets criteria requirements. Rotor angles of the nearby synchronous machines were investigated to make sure they maintained synchronism and had adequate damping following system faults.

Any wind generator must comply with FERC Order 661A on low voltage ride through requirements for wind farms. Therefore, the wind generators should not be tripped off line for faults by under voltage relay actuation. Generator speed of pre-queued projects was also monitored to ensure they stay online under system contingencies. For contingencies that result in a prior queued project tripping off-line; the contingency shall be re-run with the prior queued project's voltage and frequency tripping disabled.

2.2 Study Results – Cluster Scenario

A distance relay on (circuit 1) bus 603009 to bus 603008 operated for faults 29, 30 and 31 (FLT29-3PH, FLT30-3PH and FLT31-3PH) on Zone 1. Relay tripping problem was observed for both cluster and standalone cases. Pre-project cases were created for all three study seasons to simulate the faults, and same results were observed.

All disturbances showed no instability problems for all three seasons. All fault results are summarized in Table 2-2, which show results for the 2016 Winter Peak case, the 2017 Summer Peak case, and the 2025 Summer Peak case, respectively. The "Volt CI Violation" in the table refers to "bus voltages on the Bulk Electric System is below 0.70 per unit, 2.5 seconds after the fault is cleared or bus voltages is above 1.20 per unit after the fault is cleared", and the "Volt CII Violation" refers to "simulation end bus voltages exceed the range of 0.9 pu and 1.1 pu". All voltage violations are highlighted with **red**.

2.3 Study Results – Standalone Scenario

Since there are two interconnection requests in this study group, standalone cases were created and studied for each individual interconnection request. Similar as the cluster scenario, all disturbances showed no instability problems for all three seasons. However, as described in cluster scenario, a distance relay on (circuit 1) bus 603009 to bus 603008 operated (on Zone 1) for faults 29, 30 and 31 (FLT29-3PH, FLT30-3PH and FLT31-3PH). Pre-project cases were created for all three study seasons to simulate the fault, and same results were observed.

All fault results are summarized in Table 2-3 and Table 2-4 which show results for the 2016 Winter Peak case, 2017 Summer Peak case and 2025 Summer Peak cases respectively. The "Volt CI Violation" in the table refers to "bus voltages on the Bulk Electric System is below 0.70 per unit, after the fault is cleared or bus voltages is above 1.20 per unit after the fault is cleared", and the "Volt CII Violation" refers to "simulation end bus voltages exceed the range of 0.9 pu and 1.1 pu". All voltage violations are highlighted with **red**.

3 Short Circuit Analysis

Short circuit analysis was performed on the 2017 Summer Peak and 2025 Summer Peak power flow case using the PSS/E program (Cluster Scenario model). Since the power flow model does not contain negative and zero sequence data, only three-phase symmetrical fault current levels were calculated at up to five buses away from the point of interconnection.

Table 3-1 tabulates all the three-phase fault current levels, and the calculated values were listed here for SPP's reference.

Table 3-1 (a): Three-Phase Fault Currents GEN-2015-089 – 2017 Summer Peak

4 Power Factor Analysis

Since the studied project is a renewable energy project, power factor analysis was performed on three provided cluster scenarios upon SPP's request.

4.1 Power Factor Analysis Methodology

Power Factor Analysis was performed for the studied wind farm under system intact and contingency conditions. All N-1, three phase stability faults shown in Table 2-1 were analyzed as power flow contingencies. The power factor requirements for the wind farm were determined to maintain the voltage at the POI to the schedule voltage which is the higher of the POI voltage in the provided base case or 1.0 per unit. Fictitious var generator was added to the studied wind farm to maintain the scheduled voltage following all studied contingencies. The MW and Mvar injections from the studied wind farm at the POI were recorded and the power factors were calculated for all contingencies. The most lagging and most leading power factors determine the minimum power factor range capability required for the studied wind farm.

If more than one studied project share the same POI, the projects were grouped together and common power factor requirements were determined for this group of studied projects. With this method, none of the studied projects is required to provide more or less than its fair share of the reactive power requirements at the same POI. If a prior-queued project is connected at the same POI as the studied project, the prior-queued project was not grouped with the studied project since its reactive power requirements was determined in previous studies. However, the voltage schedules of the prior-queued project and the studied project at the same POI were coordinated and the local existing capacitor banks were set to their maximum capability, if necessary.

Per FERC and SPP requirements, if the power factor needed to maintain the scheduled voltage is less than 0.95 lagging or leading, the requirements is limited to 0.95 lagging or leading.

If the required power factor at the POI is beyond the capability of the studied wind turbine, the approximate size of the additional capacitors were determined.

.

4.2 Study Results

Power Factor Analysis was performed to ensure the studied project meets FERC and SPP power factor requirements for wind farm interconnections

Table 4-1 summarizes the power factor analysis results. The detailed power factor analysis results for each studied contingency are provided in Appendix C. Per SPP and FERC requirements, the generating facility shall be designed to meet the requirement of 95% lagging (providing vars) and 95% leading (absorbing vars) to the Point of Interconnection.

Table 4-1 Power Factor Analysis Results

Request	Size	Generator	POI	Scenario	PF Analysis Worst Scenario		Final PF Requirement	
	(MW)	Model			Leading[1]	Lagging[2]	Leading[1]	Lagging[2]
GEN-2015-089	200	GE 2.0MW wind	WAPA Utica Junction 230kV (652526)	16WP	0.987	N/A	0.95	0.95
				17SP	0.987	N/A	0.95	0.95
				25SP	0.988	0.999	0.95	0.95
GEN-2016-054	3.4 upgrade(total = 54.5MW)	GE 1.6MW wind	Wessington Springs 230kV (652607)	16WP	0.964	1.0	0.95	0.95
				17SP	0.938	0.999	0.95	0.95
				25SP	0.978	0.988	0.95	0.95

Notes:

1. Leading is when the generator is absorbing reactive power from the transmission grid.
2. Lagging is when the generator is providing reactive power to the transmission grid.

5 Low Wind/No Wind Analysis

In this study, ABB investigated the GEN-2015-089 and GEN-2016-054 projects for low wind/no wind conditions, since the interconnected wind farms are connected to 230kV buses.

5.1 Low/No Wind Analysis Methodology

Low wind/No wind analysis is performed to determine the required shunt reactor size at the study project substation high side buses to bring the MVAr flows into the POIs down to approximately zero.

For each studied scenario, the studied wind generators and capacitor bank (none in this case) were switched out of service with the collector system as modeled remaining in service. The resulting reactive power injection into the transmission network coming from the capacitance of the project's transmission lines and collector cables was measured. Then, the required shunt reactor size was calculated to bring the MVAr flows into the POIs down to approximately zero.

5.2 Study Results

Table 5-1 summaries the Low/No Wind analysis results. It is shown that 29.98 MVAr / 2.15 MVAr shunt reactors at the substation high side buses (563230 / 662100) are required to bring the MVAr flows in the POIs down to approximately zero under low/no wind conditions for all three studied seasons. The reactor bank size is approximate to be finalized during final facility and collector system design.

Table 5-1 (a): Low/No Wind Analysis Results for POI of GEN-2015-089

Scenario	Reactive Power Injection at POI (MVAr)	Bus 652526 Volt (pu)	Required Shunt Reactor (MVAr)
16WP	30.86	1.0318	**28.98**
17SP	30.48	1.0255	**28.98**
25SP	30.31	1.0226	**28.98**

Table 5-1 (b): Low/No Wind Analysis Results for POI of GEN-2016-054

Scenario	Reactive Power Injection at POI (MVAr)	Bus 652607 Volt (pu)	Required Shunt Reactor (MVAr)
16WP	2.29	1.0345	**2.14**
17SP	2.30	1.0299	**2.17**
25SP	2.29	1.0291	**2.16**

6 Conclusions

Southwest Power Pool (SPP) has commissioned ABB Inc., to perform a Definitive Impact Study for DISIS-2016-001 (Group 17) which includes generation interconnection requests GEN-2015-089 (200 MW wind farm connected to 230 kV Utica Junction), GEN-2016-054 (54.4 MW wind farm connected at 230kV Wessington Springs

Request	Size (MW)	Wind Turbine Model	Point of Interconnection
GEN-2015-089	200	GE 2.0MW wind	WAPA Utica Junction 230kV (652526)
GEN-2016-054	3.4 uprate (total = 54.4MW)	GE 1.6MW wind	Wessington Springs 230kV (652607)

The objective of this study is to evaluate the collective as well as individual impact of the three projects on the existing and future planning system. The study is performed on three system scenarios provided by SPP:

- 2016 Winter Peak Case
- 2017 Summer Peak Case
- 2025 Summer Peak Case

All the simulation results showed no stability problems and no voltage violations for all three seasons. All the simulation results were summarized in Table 2-2 and Table 2-3. Also, for the contingencies simulated GEN-2015-089 and GEN-2016-054 remained on line and, therefore, will comply with FERC Order 661A low voltage ride-through.

System short-circuit current levels at up to five buses away from the point of interconnection were calculated and tabulated for SPP's reference.

Power Factor Analysis was performed to ensure the studied project meets FERC and SPP power factor requirements for wind farm interconnections. Table 4-1 summarizes the power factor analysis results. The detailed power factor analysis results for each studied contingency are provided in Appendix C. Per SPP and FERC requirements, the generating facility shall be designed to meet the requirement of 95% lagging (providing vars) and 95% leading (absorbing vars) to the Point of Interconnection.

The Low/No Wind analysis shows that a 29.98 MVAr / 2.15 MVAr shunt reactors are required to bring the MVAr flows at two POIs down to approximate zero under low/no wind conditions for GEN-2015-089 and GEN-2016-054 respectively. The reactor bank size is approximate and the final size will be determined in the final facility and collector system design.

The results of this analysis are based on available data and assumptions made at the time of conducting this study. If any of the data and/or assumptions made in developing the study model change, the results provided in this report may not apply.

APPENDIX A SOUTHWEST POWER POOL DISTURBANCE PERFORMANCE CRITERIA REQUIREMENTS

OVERVIEW

These Disturbance Performance Requirements ("Requirements") shall be applicable to the Bulk Electric System within the Southwest Power Pool Planning Area. Utilization of these Requirements applies to all registered entities within the Southwest Power Pool Planning Area. These Requirements shall not be applicable to facilities that are not part of Bulk Electric System. More stringent Requirements are at the sole discretion of each Transmission Owner.

Transient and dynamic stability assessments are generally performed to assure adequate avoidance of loss of generator synchronism and prevention of system voltage collapse within the first 20 seconds after a system disturbance. These Requirements provide a basis for evaluating the system response during the initial transient period following a disturbance on the Bulk Electric System by establishing minimum requirements for machine rotor angle damping and transient voltage recovery.

ROTOR ANGLE DAMPING REQUIREMENT

Machine Rotor Angles shall exhibit well damped angular oscillations [as defined below] and acceptable power swings following a disturbance on the Bulk Electric System for all NERC Category A, B and C events.

Well damped angular oscillations shall meet one of the following two requirements when calculated directly from the rotor angle:

1. Successive Positive Peak Ratio (SPPR) must be less than or equal to 0.95 where SPPR is calculated as follows:

$$SPPR = \frac{\text{Peak Rotor Angle of } 2^{nd} \text{ Positive Swing Peak}}{\text{Peak Rotor Angle of } 1^{st} \text{ Positive Swing Peak}} \leq 0.95$$

   -or- Damping Factor % = (1 – SPPR) x 100% ≥ 5%

   The machine rotor angle damping ratio may be determined by appropriate modal analysis (i.e. Prony Analysis) where the following equivalent requirement must be met:

   Damping Ratio ≥ 0.0081633

2. Successive Positive Peak Ratio Five (SPPR5) must be less than or equal to 0.774 where SPPR5 is calculated as follows:

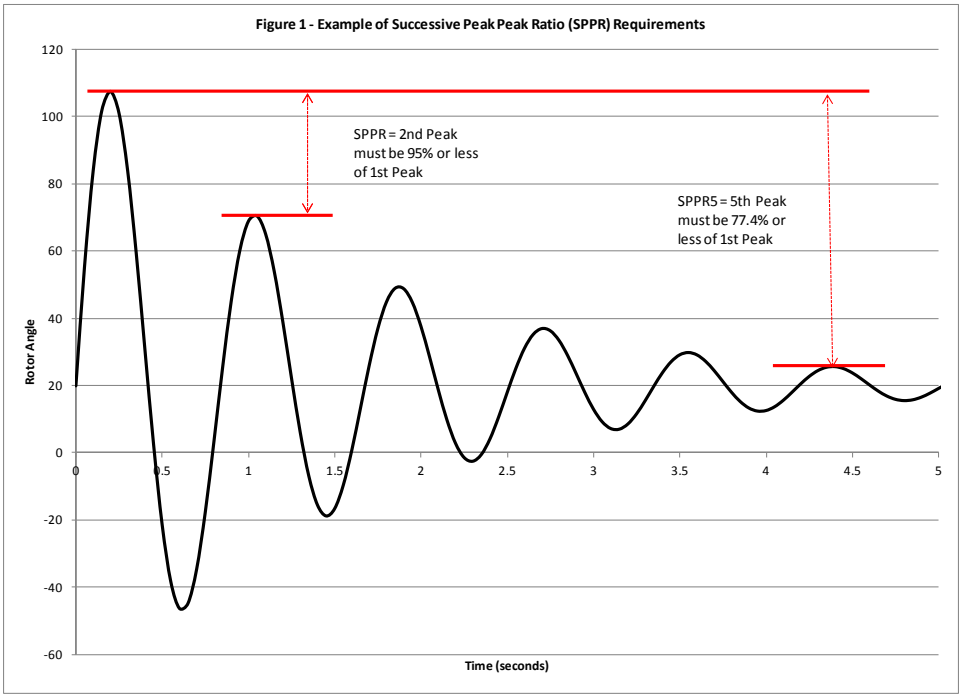
$$SPPR5 = \frac{\text{Peak Rotor Angle of } 5^{th} \text{ Positive Swing Peak}}{\text{Peak Rotor Angle of } 1^{st} \text{ Positive Swing Peak}} \leq 0.774$$

   -or- Damping Factor % = (1 – SPPR5) x 100% ≥ 22.6%

   The machine rotor angle damping ratio may be determined by appropriate modal analysis (i.e. Prony Analysis) where the following equivalent requirement must be met:

Damping Ratio ≥ 0.0081633

Qualitatively, these Requirements are shown in Figure 1 below.



TRANSIENT VOLTAGE RECOVERY REQUIREMENT

Any time after a disturbance is cleared; bus voltages on the Bulk Electric System shall not swing outside of the bandwidth of 0.70 per unit to 1.20 per unit. All post-transient voltages must fall between the 0.90 pu and 1.1 pu range at the end of the simulations. Check pre-fault voltage checks to ensure they fall within the 0.90 pu and 1.1 pu.

Qualitatively, this Requirement is shown in Figure 2 below.

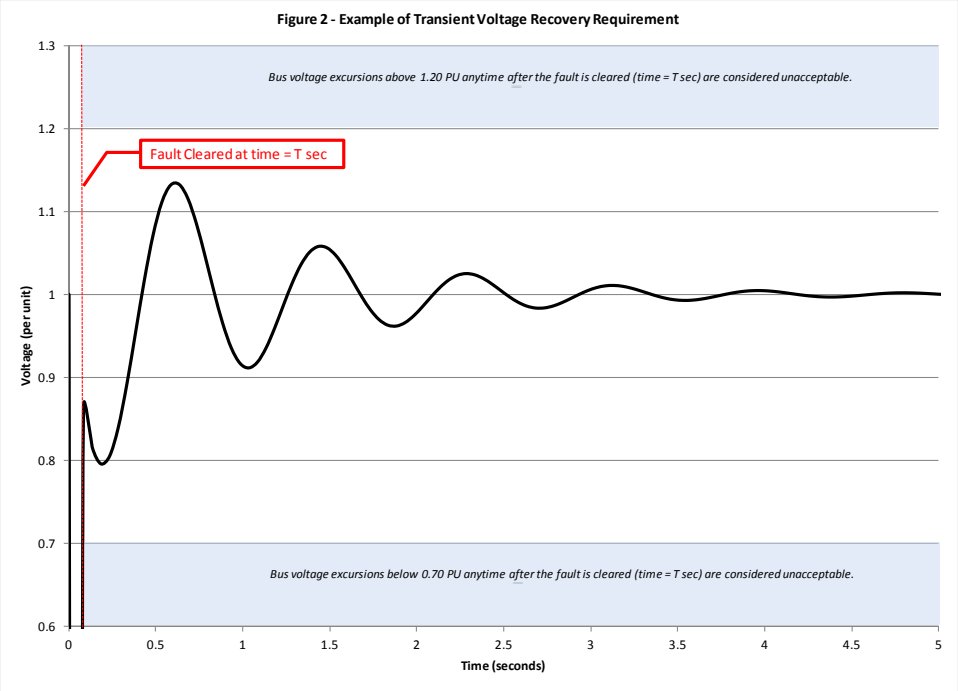


Figure 2 - Example of Transient Voltage Recovery Requirement
Bus voltage excursions above 1.20 PU anytime after the fault is cleared (time = T sec) are considered unacceptable.
Fault Cleared at time = T sec
Bus voltage excursions below 0.70 PU anytime after the fault is cleared (time = T sec) are considered unacceptable.

APPENDIX B POWER FACTOR ANALYSIS RESULTS

All the contingency numbers shown in this appendix match with the fault numbers shown in Table 2-1.

B.1 GEN-2015-089 2016 Winter Peak Case

The GEN-2015-089 POI voltage is 1.0177 pu in the provided 2016 winter peak case. Therefore, the power factor requirements for the wind farm were determined to maintain the voltage at 1.0177 pu. The lowest lagging and leading power factors are highlighted in the table below.

Outage No.		MW	Mvar	PF	
System Intact	0	-194.4	21.7	0.994	leading
Contingency	5	-194.4	24.7	0.992	leading
Contingency	6	-194.4	22.2	0.994	leading
Contingency	7	-194.5	18.6	0.995	leading
Contingency	8	-194.5	13.3	0.998	leading
Contingency	14	-194.4	24.3	0.992	leading
Contingency	15	-194.4	24.9	0.992	leading
Contingency	18	-194.5	19	0.995	leading
Contingency	23	-194.5	7.6	0.999	leading
Contingency	24	-194.3	31.5	**0.987**	leading
Contingency	27	-194.4	23.1	0.993	leading
Contingency	28	-194.5	19.8	0.995	leading
Contingency	29	-194.4	23.7	0.993	leading
Contingency	30	-194.5	18.4	0.996	leading
Contingency	31	-194.5	17.2	0.996	leading

B.2 GEN-2016-054 2016 Winter Peak Case

The GEN-2016-054 POI voltage is 1.0312 pu in the provided 2016 winter peak case. Therefore, the power factor requirements for the wind farm were determined to maintain the voltage at 1.0312 pu. The lowest lagging and leading power factors are highlighted in the table below.

Outage No.		MW	Mvar	PF	
System Intact	0	-53.6	7.9	0.989	leading
Contingency	5	-53.6	5.5	0.995	leading
Contingency	6	-53.6	5.8	0.994	leading
Contingency	7	-53.6	14.8	**0.964**	leading
Contingency	8	-53.6	-0.2	**1**	lagging

Contingency	30	-53.6	6.7	0.992	leading
Contingency	31	-53.6	6.5	0.993	leading

B.2-1 GEN-2015-089 2017 Summer Peak Case

The GEN-2015-089 POI voltage is 1.0119 pu in the provided 2017 summer peak case. Therefore, the power factor requirements for the wind farm were determined to maintain the voltage at 1.0119 pu. The lowest lagging and leading power factors are highlighted in the table below.

Outage No.		MW	Mvar	PF	
System Intact	0	-194.4	17.6	0.996	leading
Contingency	5	-194.4	23.8	0.993	leading

SUMMARY

Southwest Power Pool (SPP) has commissioned ABB Inc., to perform a Definitive Impact Study for DISIS-2016-001 (GROUP 18) which includes generation interconnection request GEN-2016-007 (100 MW wind farm connected at WAPA Valley city 115 kV Bus).

Request	Size (MW)	Generator Model	POI
GEN-2016-007	100.0	VESTAS V126 GS 3.45MW WIND	WAPA Valley City 115kV (652454)

The objective of this study is to evaluate the impact of project GEN-2016-007 on the existing and future planning system. The study is performed on three system scenarios provided by SPP:

- 2016 Winter Peak Case
- 2017 Summer Peak Case
- 2025 Summer Peak Case

The scope of the study included stability analysis, short-circuit analysis, Power factor evaluation and low/no wind condition analysis. The following is a summary of study results.

Results of the Stability Analysis show no stability criteria violations for all studied disturbances for the three seasons.

System short-circuit current levels at up to seven buses away from the point of interconnection were calculated and tabulated for SPP's reference.

Power Factor Analysis was performed to ensure the studied project meets FERC and SPP power factor requirements for wind farm interconnections. The results show that the wind farm is required to meet the SPP pro-forma 95% lagging (providing vars) and 95% leading (absorbing vars) power factor requirements at the Point of Interconnection.

The Low/No wind analysis shows that 2.74MVAr of shunt reactor is required at the POI to bring the MVAr flow at the POI down to approximately zero under low wind conditions for all three studied seasons. The reactor bank size is approximate and the final size will be determined in the final facility and collector system design.

1 Introduction

Southwest Power Pool (SPP) has commissioned ABB Inc., to perform a Definitive Impact Study for DISIS-2016-001 (GROUP 18) which includes generation interconnection request GEN-2016-007 (100 MW wind farm connected at WAPA Valley city 115 kV Bus) as shown in Table 1-1.

Table 1-1: GROUP 18 Generation Interconnection Requests

Request	Size (MW)	Generator Model	POI
GEN-2016-007	100.0	VESTAS V126 GS 3.45MW WIND	WAPA Valley City 115kV (652454)

The objective of this study is to evaluate the impact of project GEN-2016-007 on the existing and future planning system.

The scope of the study included stability analysis, short-circuit analysis, power factor evaluation and low/no wind conditions analysis.

The study is performed on three system scenarios provided by SPP:

- 2016 Winter Peak Case
- 2017 Summer Peak Case
- 2025 Summer Peak Case

In the process of the study, ABB prepared the fault definition list and sent to SPP for review on October 18, 2016. The fault definitions were approved on October 28, 2016 and ABB was requested to proceed with the studies.

SPP provided the study cases for all three system scenarios with GEN-2016-007 included.

The three system scenarios supplied by SPP included the following prior queued projects for GROUP 18:

Table 1-2: GROUP 18 Prior Queued Projects

Request	Size (MW)	Generator Model	Point of Interconnection
GEN-2002-008IS	40.5	wind	Edgeley 115kV [Pomona 115kV] (659280)
GEN-2005-003IS	115.0	wind	Nelson 115kV (652440)
GEN-2006-001IS	10.0	wind	Marshall 115kV (652508)
GEN-2006-006IS	10.0	wind	Marshall 115kV (652508)
GEN-2007-020IS	16.0	wind	Nelson 115kV (652440)
GEN-2008-008IS	5.0	wind	Nelson 115kV (652440)

The one line diagram of the local area for all three seasons for the study project is shown in Figure 1-1.

2 STABILITY ANALYSIS

In this study, ABB investigated the stability of the system for faults in the vicinity of the proposed plant as defined by SPP. The studied faults involve three-phase transformer faults with normal clearing, three-phase line faults with normal clearing, and single-line-to-ground faults with stuck breaker (SB-1PH).

2.1 STABILITY ANALYSIS METHODOLOGY

Stability analysis is performed to determine whether the electric system would meet stability criteria following the addition of the GEN-2016-007 project. Stability analysis was performed using Siemens-PTI's PSS/E dynamics program V32.2.0. All the faults listed in Table 2 1 were simulated for 20 seconds.

Table 2-1: List of Faults for Stability Analysis

Cont. No.	Cont. Name	Description
1	FLT01-3PH	3 phase fault on the VALLEY CITY 115KV (652454) to ENDERLIN 115KV (652638) CKT 1, near VALLEY CITY. a. Apply fault at the VALLEY CITY 115KV bus. a. b. Clear fault after 7 cycles by tripping the faulted line (CKT 1).
2	FLT02-3PH	3 phase fault on the VALLEY CITY 115KV (652454) to JAMESTOWN 115KV (652445) CKT 1, near VALLEY CITY. a. Apply fault at the VALLEY CITY 115KV bus. a. b. Clear fault after 7 cycles by tripping the faulted line (CKT 1).
3	FLT03-3PH	3 phase fault on the ENDERLIN 115KV (652638) to ELLIOTT 115KV (652462) CKT 1, near ENDERLIN. a. Apply fault at the ENDERLIN 115KV bus. a. b. Clear fault after 7 cycles by tripping the faulted line (CKT 1).
4	FLT04-3PH	3 phase fault on the ELLIOTT 115KV (652462) to FORMAN 115KV (652438) CKT 1, near ELLIOTT. a. Apply fault at the ELLIOTT 115KV bus. a. b. Clear fault after 7 cycles by tripping the faulted line (CKT 1).
5	FLT05-3PH	3 phase fault on the JAMESTOWN 115KV (652445) to JAMESTOWN 230kV (652444) to JAMESTOWN 13.2kV (652208) XMFR CKT 1, near JAMESTOWN 115kV. a. Apply fault at the JAMESTOWN 115kV bus. a. b. Clear fault after 7 cycles by tripping the faulted transformer.

Cont. No.	Cont. Name	Description
6	FLT06-3PH	3 phase fault on the JAMESTOWN 115KV (652445) to CARINGTON 115KV (652428) CKT 1, near JAMESTOWN. a. Apply fault at the JAMESTOWN 115KV bus. a. b. Clear fault after 7 cycles by tripping the faulted line (CKT 1).
7	FLT07-3PH	3 phase fault on the JAMESTOWN 115KV (652445) to EDGELEY 115KV (652432) CKT 1, near JAMESTOWN. a. Apply fault at the JAMESTOWN 115KV bus. a. b. Clear fault after 7 cycles by tripping the faulted line (CKT 1).
8	FLT08-3PH	3 phase fault on the EDGELEY 115KV (652432) to ORDWAY115KV (652534) CKT 1, near EDGELEY. a. Apply fault at the EDGELEY 115KV bus. b. Clear fault after 7 cycles by tripping the faulted line (CKT 1).
9	FLT09-3PH	3 phase fault on the CARINGTON 115KV (652428) to BARLOW 115KV (652423) CKT 1, near CARINGTON. a. Apply fault at the CARINGTON 115KV bus. b. Clear fault after 7 cycles by tripping the faulted line (CKT 1).
10	FLT10-3PH	3 phase fault on the JAMESTOWN 230KV (652444) to BISMARK 230KV (652426) CKT 1, near JAMESTOWN. a. Apply fault at the JAMESTOWN 230KV bus. b. Clear fault after 6 cycles by tripping the faulted line (CKT 1).
11	FLT11-3PH	3 phase fault on the JAMESTOWN 230KV (652444) to GARRISON 230KV (652441) CKT 1, near JAMESTOWN. a. Apply fault at the JAMESTOWN 230KV bus. b. Clear fault after 6 cycles by tripping the faulted line (CKT 1).
12	FLT12-3PH	3 phase fault on the JAMESTOWN 230KV (652444) to FARGO 230KV (652435) CKT 1, near JAMESTOWN. a. Apply fault at the JAMESTOWN 230KV bus. b. Clear fault after 6 cycles by tripping the faulted line (CKT 1).
13	FLT13-3PH	3 phase fault on the JAMESTOWN 230KV (652444) to WEBER 230KV (661028) CKT 1, near JAMESTOWN. a. Apply fault at the JAMESTOWN 230KV bus. b. Clear fault after 6 cycles by tripping the faulted line (CKT 1).

Cont. No.	Cont. Name	Description
14	FLT14-3PH	3 phase fault on the JAMESTOWN 345KV (620369) to CENTRE 345KV (657791) CKT 1, near JAMESTOWN. a. Apply fault at the JAMESTOWN 345KV bus. b. Clear fault after 6 cycles by tripping the faulted line (CKT 1).
15	FLT15-3PH	3 phase fault on the JAMESTOWN 345KV (620369) to BUFFALO 345KV (620358) CKT 1, near JAMESTOWN. a. Apply fault at the JAMESTOWN 345KV bus. b. Clear fault after 6 cycles by tripping the faulted line (CKT 1).
16	FLT16-3PH	3 phase fault on the BUFFALO 345KV (620358) to BISON 345KV (601067) CKT 1, near BUFFALO a. Apply fault at the BUFFALO 345KV bus. b. Clear fault after 6 cycles by tripping the faulted line (CKT 1).
17	FLT17-3PH	3 phase fault on the LELAND OLDS 345KV (659422) to G16-044-TAP 345KV (560079) CKT 1, near LELAND OLDS a. Apply fault at the LELAND OLDS 345KV bus. b. Clear fault after 6 cycles by tripping the faulted line (CKT 1).
18	FLT18-3PH	3 phase fault on the LELAND OLDS 345KV (659424) to G16-017-TAP 345KV (560074) CKT 1, near LELAND OLDS a. Apply fault at the LELAND OLDS 345KV bus. b. Clear fault after 6 cycles by tripping the faulted line (CKT 1).
19	FLT19-3PH	3 phase fault on the ANTELOPE VALLEY 345KV (659420) to BROADLAND 345KV (659421) CKT 1, near ANTELOPE VALLEY a. Apply fault at the ANTELOPE VALLEY 345KV bus. b. Clear fault after 6 cycles by tripping the faulted line (CKT 1).
20	FLT20-PO	Prior Outage of VALLEY CITY (652454) to JAMESTOWN (652445) 115kV. 3 phase fault on the FORMAN (652438) –LUDDEN (659172) 115kV line. a. Prior outage VALLEY CITY (652454) to JAMESTOWN (652445) 115kV (solve network for steady state solution). b. 3 phase fault on the FORMAN (652438) –LUDDEN (659172) 115kV line near FORMAN 115kV. c. Leave fault on for 7 cycles, then trip the faulted line in (b).

Cont. No.	Cont. Name	Description
21	FLT21-PO	Prior Outage of VALLEY CITY (652454) to JAMESTOWN (652445) 115kV. 3 phase fault on the FORMAN (652438) –ROBERTS CO. (659171) 115kV line. a. Prior outage VALLEY CITY (652454) to JAMESTOWN (652445) 115kV (solve network for steady state solution). b. 3 phase fault on the FORMAN (652438) –ROBERTS CO. (659171) 115kV line near FORMAN 115kV. c. Leave fault on for 7 cycles, then trip the faulted line in (b).
22	FLT22-PO	Prior Outage of VALLEY CITY (652454) to ENDERLIN (652638) 115kV. 3 phase fault on the JAMESTOWN (652445) – CARRINGTON (652428) 115kV line. a. Prior outage VALLEY CITY (652454) to ENDERLIN (652638) 115kV (solve network for steady state solution). b. 3 phase fault on the JAMESTOWN (652445) – CARRINGTON (652428) 115kV line near JAMESTOWN 115kV. c. Leave fault on for 7 cycles, then trip the faulted line in (b).
23	FLT23-PO	Prior Outage of VALLEY CITY (652454) to ENDERLIN (652638) 115kV. 3 phase fault on the JAMESTOWN (652445) – CARRINGTON (652428) 115kV line. a. Prior outage VALLEY CITY (652454) to ENDERLIN (652638) 115kV (solve network for steady state solution). b. 3 phase fault on the JAMESTOWN (652445) – EDGELEY (652432) 115kV line near JAMESTOWN 115kV. c. Leave fault on for 7 cycles, then trip the faulted line in (b).
24	FLT24-SB	VALLEY CITY 115kV Stuck Breaker a. Apply single phase fault on the VALLEY CITY 115KV (652454) to ENDERLIN 115KV (652638) CKT 1, near VALLEY CITY. b. Wait 16 cycles, and then trip VALLEY CITY 115KV (652454) to ENDERLIN 115KV (652638) CKT 1 115kV line and remove fault.
25	FLT25-SB	VALLEY CITY 115kV Stuck Breaker a. Apply single phase fault on the VALLEY CITY 115KV (652454) to JAMESTOWN 115KV (652445) CKT 1, near VALLEY CITY. b. Wait 16 cycles, and then trip VALLEY CITY 115KV (652454) to JAMESTOWN 115KV (652445) CKT 1 115kV line and remove fault.

Cont. No.	Cont. Name	Description
26	FLT26-SB	ENDERLIN 115kV Stuck Breaker a. Apply single phase fault at the ENDERLIN (652638) 115kV bus on the ENDERLIN (652638) – ELLIOTT (652462) 115kV line. b. Wait 16 cycles, and then trip ENDERLIN (652638) – ELLIOTT (652462) 115kV line. c. Trip ENDERLIN (652638) to VALLEY CITY (652454) 115kV line and remove the fault.
27	FLT27-SB	JAMESTOWN 115kV Stuck Breaker a. Apply single phase fault at the JAMESTOWN (652445) 115kV bus on the JAMESTOWN (652445) – CARINGTON (652428) 115kV line. b. Wait 16 cycles, and then trip JAMESTOWN (652445) – CARINGTON (652428) 115kV line. c. Trip JAMESTOWN (652445) to VALLEY CITY 115KV (652454) line and remove the fault.
28	FLT28-SB	JAMESTOWN 115kV Stuck Breaker a. Apply single phase fault at the JAMESTOWN (652445) 115kV bus on the JAMESTOWN (652445) – CARINGTON (652428) 115kV line. b. Wait 16 cycles, and then trip JAMESTOWN (652445) – CARINGTON (652428) 115kV line. c. Trip JAMESTOWN (652445) to EDGELEY (652432) 115kV line and remove the fault.
29	FLT29-SB	JAMESTOWN 230kV Stuck Breaker a. Apply single phase fault at the JAMESTOWN (652444) 230kV bus on the JAMESTOWN (652444) – PICKERT (657759) 230kV line. b. Wait 16 cycles, and then trip JAMESTOWN (652444) – PICKERT (657759) 230kV line. c. Trip JAMESTOWN (652444) to BISMARK (652426) 230kV line and remove the fault.
30	FLT30-SB	JAMESTOWN 230kV Stuck Breaker a. Apply single phase fault at the JAMESTOWN (652444) 230kV bus on the JAMESTOWN (652444) – WEBER (661028) 230kV line. b. Wait 16 cycles, and then trip JAMESTOWN (652444) – WEBER (661028) 230kV line. c. Trip JAMESTOWN (652444) to BISMARK (652426) 230kV line and remove the fault.

Cont. No.	Cont. Name	Description
31	FLT31-SB	JAMESTOWN 230kV Stuck Breaker a. Apply single phase fault at the JAMESTOWN (652444) 230kV bus on the JAMESTOWN (652444) – PICKERT (657759) 230kV line. b. Wait 16 cycles, and then trip JAMESTOWN (652444) – PICKERT (657759) 230kV line. c. Trip JAMESTOWN (652444) 230kV to JAMESTOWN (652445) 115kV to JAMESTOWN (652208) 13.8kV transformer and remove the fault.
32	FLT32-SB	JAMESTOWN 230kV Stuck Breaker a. Apply single phase fault at the JAMESTOWN (652444) 230kV bus on the JAMESTOWN (652444) – WEBER (661028) 230kV line. b. Wait 16 cycles, and then trip JAMESTOWN (652444) – WEBER (661028) 230kV line. c. Trip JAMESTOWN (652444) 230kV to JAMESTOWN (652445) 115kV to JAMESTOWN (652208) 13.8kV transformer and remove the fault.
33	FLT33-SB	JAMESTOWN 230kV Stuck Breaker a. Apply single phase fault at the JAMESTOWN (652444) 230kV bus on the JAMESTOWN (652444) – GARRISON (652441) 230kV line. b. Wait 16 cycles, and then trip JAMESTOWN (652444) – GARRISON (652441) 230kV line. c. Trip JAMESTOWN (652444) to BISMARK (652426) 230kV line and remove the fault.
34	FLT34-SB	JAMESTOWN 230kV Stuck Breaker a. Apply single phase fault at the JAMESTOWN (652444) 230kV bus on the JAMESTOWN (652444) – GARRISON (652441) 230kV line. b. Wait 16 cycles, and then trip JAMESTOWN (652444) – GARRISON (652441) 230kV line. c. Trip JAMESTOWN (652444) 230kV to JAMESTOWN (652445) 115kV to JAMESTOWN (652208) 13.8kV transformer and remove the fault.
35	FLT35-SB	JAMESTOWN 345kV Stuck Breaker a. Apply single phase fault at the JAMESTOWN (620369) 345kV bus on the JAMESTOWN (620369) – CENTRE (657791) 345kV line. b. Wait 16 cycles, and then trip JAMESTOWN (620369) – CENTRE (657791) 345kV line. c. Trip JAMESTOWN (620369) 345kV to JAMESTOWN (620269) 115kV to JAMESTOWN (620169) 41.6kV transformer and remove the fault.

Cont. No.	Cont. Name	Description
36	FLT36-SB	JAMESTOWN 345kV Stuck Breaker a. Apply single phase fault at the JAMESTOWN (620369) 345kV bus on the JAMESTOWN (620369) – BUFFALO (620358) 345kV line. b. Wait 16 cycles, and then trip JAMESTOWN (620369) – BUFFALO (620358) 345kV line. c. Trip JAMESTOWN (620369) 345kV to JAMESTOWN (620269) 115kV to JAMESTOWN (620169) 41.6kV transformer and remove the fault.

Single-line-to-ground faults were simulated with the standard method of applying fault impedance to the positive sequence network to represent the effect of the negative and zero sequence networks on the positive sequence network.

The Southwest Pool Disturbance Performance Criteria Requirements in Appendix A were used to evaluate system response during the initial transient period following a disturbance on the system. Generator responses and bus voltages (115 kV and above) in Areas 330 (AECI), 356 (AMMO), 600 (XEL), 615 (GRE), 620 (OTP), 635 (MEC), 640 (NPPD), 645 (OPPD), 652 (WAPA) and 661 (MDU) were monitored to ensure that the system performance meets criteria. Rotor angles of nearby synchronous generators were plotted to verify whether the generators maintained synchronism and had adequate damping following system disturbances.

SPP requires generators relying on newer technologies to comply with low voltage ride through requirements as stipulated in FERC Order 661A. See Appendix G of the "Southwest Power Pool - Open Access Transmission Tariff, Sixth Revised Volume No. 1 - Attachment V Generator Interconnection Procedures (GIP)"[1]. According to these requirements, such generators should not be tripped off line for faults by under voltage relay actuation. Generator speeds of pre-queued projects were also monitored to ensure they stay online under system contingencies. For contingencies that result in a prior queued project tripping off-line, SPP requires those contingencies to be re-run with the prior queued project's voltage and frequency tripping disabled.

[1] http://sppoasis.spp.org/documents/swpp/transmission/studies/Attachment_V_GIP.pdf

2.2 STUDY RESULTS

No disturbances (including all n-1 and stuck breaker disturbances) showed instability problems or voltage violations for three seasons. The proposed wind farm ride through all faults without tripping. Fault results are summarized in Table 2-2, Table 2-3, and Table 2-4, which show results for the 2016 Winter Peak case, the 2017 Summer Peak case, and the 2025 Summer Peak case, respectively. The “Volt CI Violation” in the table refers to bus voltages exceeding the range of 0.7 pu. or 1.2 pu, 2.5 second after fault clearing, and the “Volt CII Violation” refers to end bus voltages exceeding the range of 0.9 pu. or 1.1 pu at the end of the simulation.

Note:

It is noted that Contingency (FLT-17) ‘loss of LELAND OLDS 345KV (659422) to G16-044-TAP 345KV (560079) CKT 1 observed the tripping of G16-044GEN1 (Bus #587293) generator on overvoltage in 2016 winter peak and 2017 summer peak cases. The tripping was also observed without the studied project. Since it is a pre-existing problem or in other words the tripping is not due to the studied project further investigations were not carried out in this study.

Figure 2-1 shows the response of the studied generator following contingency FLT01-3PH for 2016 Winter Peak case. The active and reactive power output, terminal voltage and speed are plotted to show the generator response.

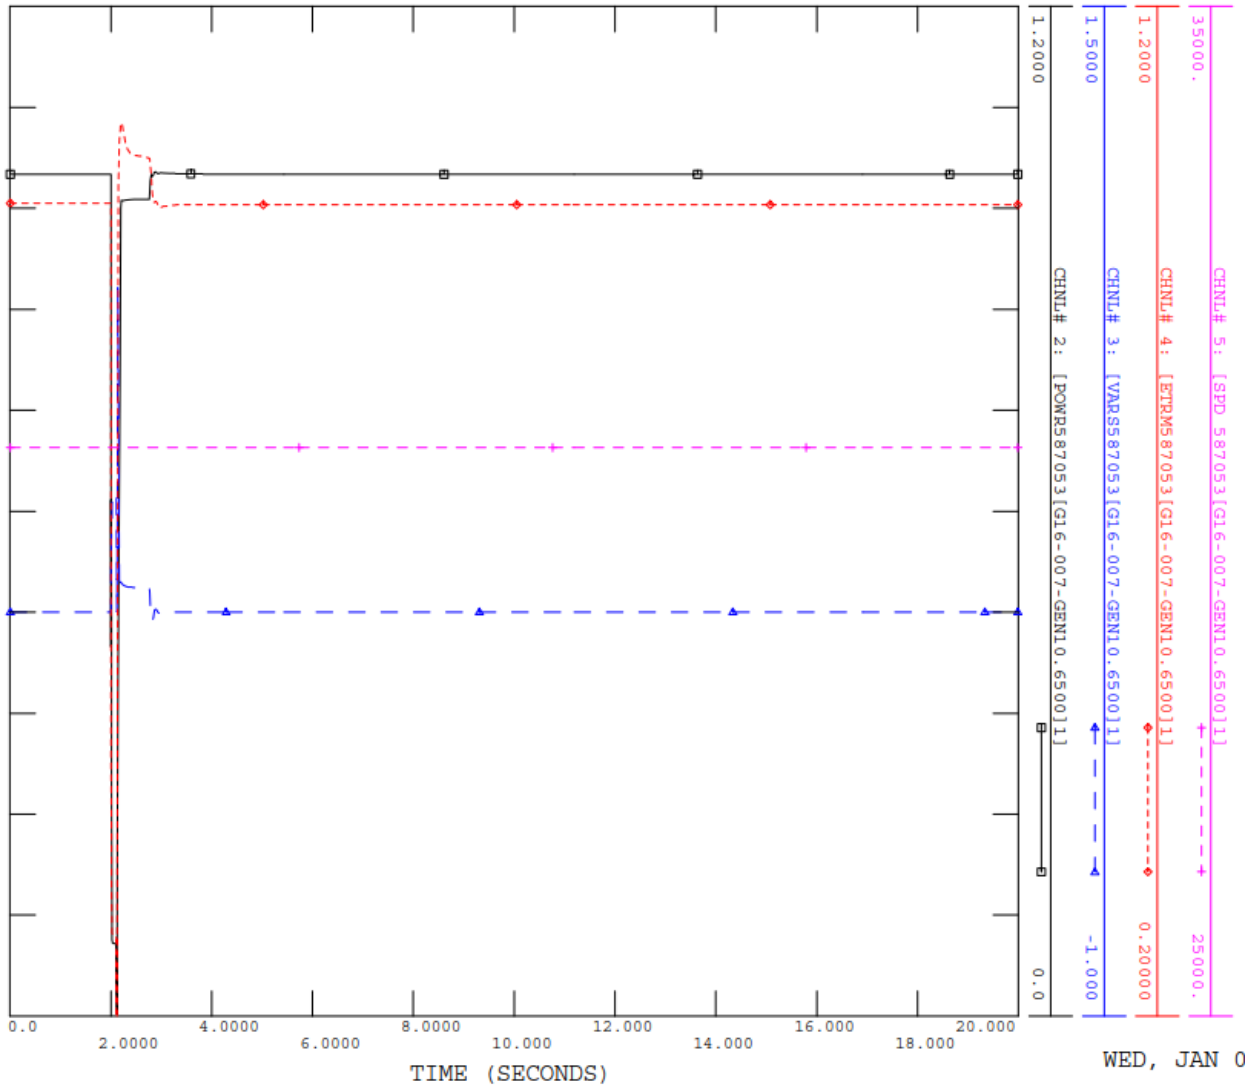

Figure 2-1: GEN-2016-007 Response Following Fault FLT01-3PH for 2016 Winter Peak Case

In all three seasons (2016 Winter Peak, 2017 Summer Peak and 2025 Summer Peak) the initial simulations showed oscillations at wind generator bus 658020 for faults near Jamestown 230 kV and Jamestown 345 kV Bus (Contingencies - FLT10-3PH, FLT11-3PH, FLT12-3PH FLT13-3PH, FLT14-3PH, FLT15-3PH, FLT16-3PH, FLT17-3PH, FLT18-3PH, FLT19-3PH, FLT29-3SB, FLT30-3SB, FLT31-3SB, FLT32-3SB, FLT33-3SB, FLT34-3SB, FLT35-3SB, and FLT36-3SB). This is a Group 18 prior queued project and the POI is Marshall 115kV. No oscillations were observed at studied project. All these faults were re-run without the studied project and results

still exhibit the oscillations. Figure 2-2 shows the response of the prior queued generator at bus 658020 following a contingency FLT10-3PH for 2016 winter peak case.

Since the generator at bus 658020 is far remote from the study project and the oscillations resulting from faults near the Jamestown 230kV and 345kV were determined to be pre-existing, the generator is netted at its schedule dispatch using PSS/E activity 'GNET' for these contingencies.

All the simulation plots are included in Appendix B.

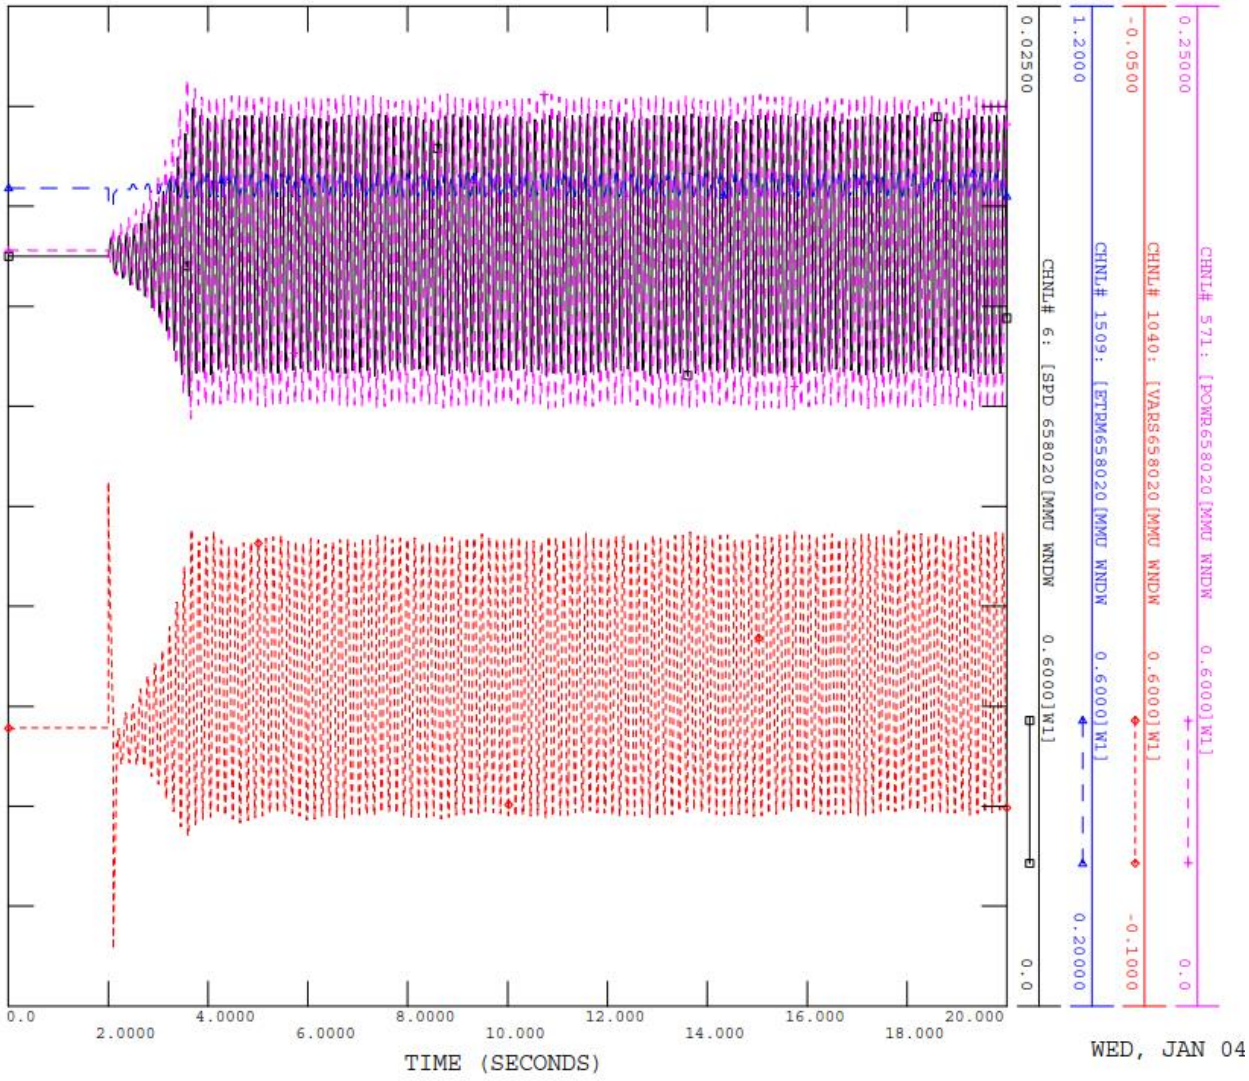

Figure 2-2 Prior Queued project at Marshall 115kV POI Response - Fault FLT10-3PH for 2016 Winter Peak Case

3 SHORT CIRCUIT ANALYSIS

Short circuit analysis was performed on the 2017 Summer Peak and 2025 Summer Peak power flow cases using the PSS/E program. Three-phase symmetrical fault current levels were calculated at up to seven buses away from the point of interconnection. Table 3-1 tabulates the calculated three-phase fault current levels at buses rated 69 kV and above.

4 POWER FACTOR ANALYSIS

Since the studied project is a renewable energy project, power factor analysis was performed on three provided cluster scenarios upon SPP's request.

4.1 POWER FACTOR ANALYSIS METHODOLOGY

Power Factor Analysis was performed for the studied wind farm under system intact and contingency conditions. All N-1, three phase stability faults shown in Table 2-1 were analyzed as power flow contingencies. The power factor requirements for the wind farm were determined to maintain the voltage at the POI to the schedule voltage which is the higher of the POI voltage in the provided base case or 1.0 per unit. Fictitious VAR generator was added to the studied wind farm to maintain the scheduled voltage following all studied contingencies. The MW and Mvar injections from the studied wind farm at the POI were recorded and the power factors were calculated for all contingencies. The most lagging and most leading power factors determine the minimum power factor range capability required for the studied wind farm.

If more than one studied project share the same POI, the projects were grouped together and common power factor requirements were determined for this group of studied projects. With this method, none of the studied projects is required to provide more or less than its fair share of the reactive power requirements at the same POI. If a prior-queued project is connected at the same POI as the studied project, the prior-queued project was not grouped with the studied project since its reactive power requirements was determined in previous studies. However, the voltage schedules of the prior-queued project and the studied project at the same POI were coordinated and the local existing capacitor banks were set to their maximum capability, if necessary.

Per FERC and SPP requirements, if the power factor needed to maintain the scheduled voltage is less than 0.95 lagging or leading, the requirements is limited to 0.95 lagging or leading.

If the required power factor at the POI is beyond the capability of the studied wind turbine, the approximate size of the additional capacitors were determined.

4.2 STUDY RESULTS

Power Factor Analysis was performed to ensure the studied project meets FERC and SPP power factor requirements for wind farm interconnections.

Table 4-1 summarizes the power factor analysis results. The detailed power factor analysis results for each studied contingency are provided in Appendix C. Per SPP and FERC requirements, the generating facility shall be designed to meet the requirement of 95% lagging (providing vars) and 95% leading (absorbing vars) to the Point of Interconnection.

Table 4-1 Power Factor Analysis Results

Request	Size	Generator	POI	Scenario	PF Analysis Worst Scenario		Final PF Requirement	
	(MW)	Model			Leading[1]	Lagging[2]	Leading[1]	Lagging[2]
GEN-2016-007	100	Vestas V126 GS 3.45MW wind	WAPA Valley City 115kV (652454)	16WP	0.973	N/A	0.95	0.95
				17SP	0.972	N/A	0.95	0.95
				25SP	0.983	N/A	0.95	0.95

Notes:

1. Leading is when the generator is absorbing reactive power from the transmission grid.
2. Lagging is when the generator is providing reactive power to the transmission grid.

5 LOW WIND/NO WIND ANALYSIS

In this study, ABB investigated the GEN-2016-007 project for low wind conditions, since the interconnected wind farm is connected at an 115kV bus.

5.1 LOW/NO WIND ANALYSIS METHODOLOGY

Low wind/No wind analysis is performed to determine the required shunt reactor size at the study project substation high side bus to bring the MVAr flow into the POI down to approximately zero.

For each studied scenario, the studied wind generator and capacitor bank (none in this case) was switched out of service with the collector system as modeled remaining in service. The resulting reactive power injection into the transmission network coming from the capacitance of the project's transmission lines and collector cables was measured. Then, the required shunt reactor size was calculated to bring the MVAr flow into the POI down to approximately zero.

5.2 STUDY RESULTS

Table 5-1 summarizes the Low wind conditions analysis results. It is shown that 2.74 MVAr shunt reactor at the substation high side bus (652454) is required to bring the MVAr flow in the POI down to approximately zero under low/no wind conditions for all three studied seasons. The reactor bank size is approximate and the final size will be determined in the final facility and collector system design.

Table 5-1 Low/No Wind Analysis Results

Scenario	Reactive Power Injection at POI (MVAr)	Bus 531424 Volt (pu)	Required Shunt Reactor (MVAr)
16WP	2.8	1.0137	**2.74**
17SP	2.8	1.0099	**2.74**
25SP	2.8	1.0025	**2.74**

6 CONCLUSIONS

Southwest Power Pool (SPP) has commissioned ABB Inc., to perform a Definitive Impact Study for DISIS-2016-001 (GROUP 18) which includes generation interconnection request GEN-2016-007 (100 MW wind farm connected at the Valley city 115 kV bus).

Request	Size (MW)	Generator Model	POI
GEN-2016-007	100.0	VESTAS V126 GS 3.45MW WIND	WAPA Valley City 115kV (652454)

The objective of this study is to evaluate the impact of project GEN-2016-007 on the existing and future planning system. The study is performed on three system scenarios provided by SPP:

- 2016 Winter Peak Case
- 2017 Summer Peak Case
- 2025 Summer Peak Case

The scope of the study included stability analysis, short-circuit analysis, Power factor evaluation and low/no wind condition analysis. The following is a summary of study results.

Results of the Stability Analysis show no stability criteria violations for all studied disturbances for the three seasons.

System short-circuit current levels at up to seven buses away from the point of interconnection were calculated and tabulated for SPP's reference.

Power Factor Analysis was performed to ensure the studied project meets FERC and SPP power factor requirements for wind farm interconnections. The results show that the wind farm is required to meet the SPP pro-forma 95% lagging (providing vars) and 95% leading (absorbing vars) power factor requirements at the Point of Interconnection.

The Low/No wind analysis shows that 2.74MVAr of shunt reactor is required at the POI to bring the MVAr flow at the POI down to approximately zero under low wind conditions for all three studied seasons. The reactor bank size is approximate and the final size will be determined in the final facility and collector system design.

The results of this analysis are based on available data and assumptions made at the time of conducting this study. If any of the data and/or assumptions made in developing the study model change, the results provided in this report may not apply.

APPENDIX A SOUTHWEST POWER POOL DISTURBANCE PERFORMANCE CRITERIA REQUIREMENTS

OVERVIEW

These Disturbance Performance Requirements ("Requirements") shall be applicable to the Bulk Electric System within the Southwest Power Pool Planning Area. Utilization of these Requirements applies to all registered entities within the Southwest Power Pool Planning Area. These Requirements shall not be applicable to facilities that are not part of Bulk Electric System. More stringent Requirements are at the sole discretion of each Transmission Owner.

Transient and dynamic stability assessments are generally performed to assure adequate avoidance of loss of generator synchronism and prevention of system voltage collapse within the first 20 seconds after a system disturbance. These Requirements provide a basis for evaluating the system response during the initial transient period following a disturbance on the Bulk Electric System by establishing minimum requirements for machine rotor angle damping and transient voltage recovery.

ROTOR ANGLE DAMPING REQUIREMENT

Machine Rotor Angles shall exhibit well damped angular oscillations [as defined below] and acceptable power swings following a disturbance on the Bulk Electric System for all NERC Category A, B and C events.

Well damped angular oscillations shall meet one of the following two requirements when calculated directly from the rotor angle:

1. Successive Positive Peak Ratio (SPPR) must be less than or equal to 0.95 where SPPR is calculated as follows:

$$SPPR = \frac{\text{Peak Rotor Angle of } 2^{nd} \text{ Positive Swing Peak}}{\text{Peak Rotor Angle of } 1^{st} \text{ Positive Swing Peak}} \leq 0.95$$

   -or- Damping Factor % = (1 – SPPR) x 100% ≥ 5%

   The machine rotor angle damping ratio may be determined by appropriate modal analysis (i.e. Prony Analysis) where the following equivalent requirement must be met:

   Damping Ratio ≥ 0.0081633

2. Successive Positive Peak Ratio Five (SPPR5) must be less than or equal to 0.774 where SPPR5 is calculated as follows:

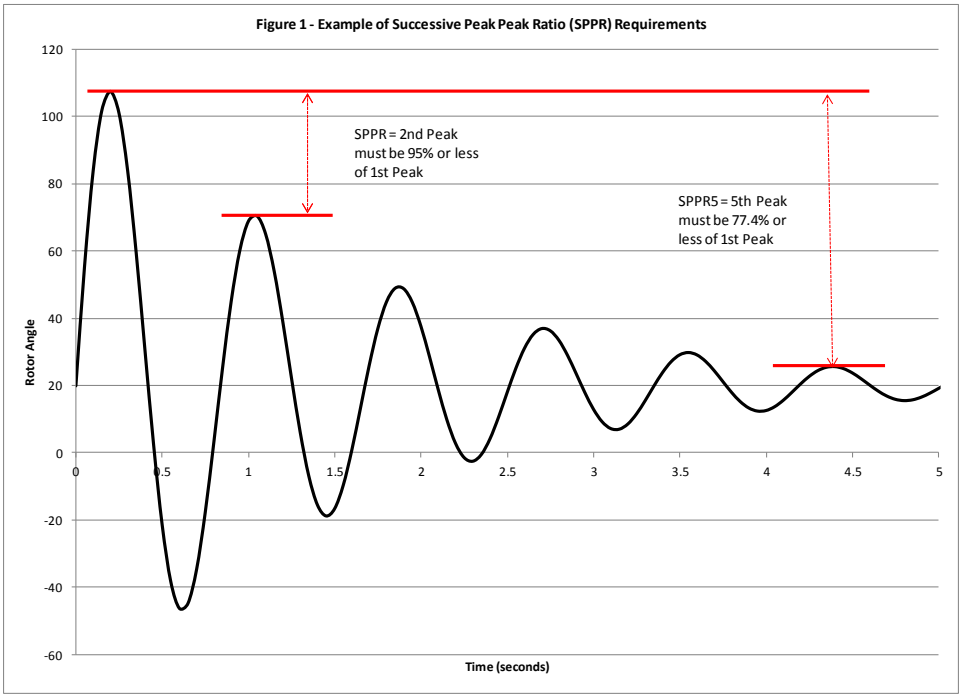
$$SPPR5 = \frac{\text{Peak Rotor Angle of } 5^{th} \text{ Positive Swing Peak}}{\text{Peak Rotor Angle of } 1^{st} \text{ Positive Swing Peak}} \leq 0.774$$

   -or- Damping Factor % = (1 – SPPR5) x 100% ≥ 22.6%

   The machine rotor angle damping ratio may be determined by appropriate modal analysis (i.e. Prony Analysis) where the following equivalent requirement must be met:

Damping Ratio ≥ 0.0081633

Qualitatively, these Requirements are shown in Figure 1 below.



TRANSIENT VOLTAGE RECOVERY REQUIREMENT

Any time after a disturbance is cleared; bus voltages on the Bulk Electric System shall not swing outside of the bandwidth of 0.70 per unit to 1.20 per unit. All post-transient voltages must fall between the 0.90 pu and 1.1 pu range at the end of the simulations. Check pre-fault voltage checks to ensure they fall within the 0.90 pu and 1.1 pu.

Qualitatively, this Requirement is shown in Figure 2 below.

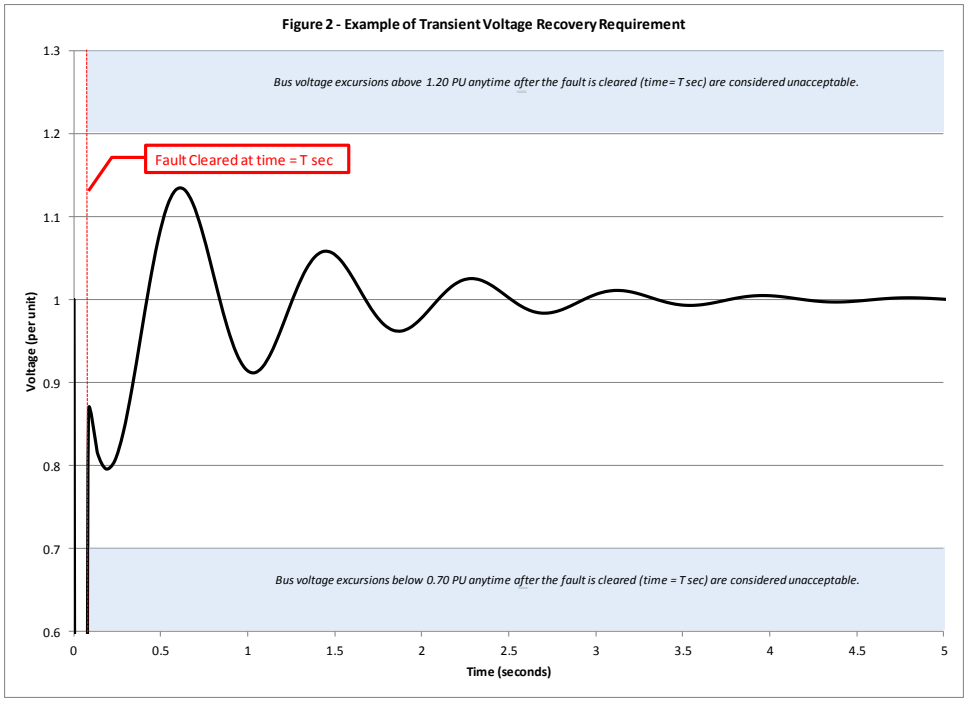


Figure 2 - Example of Transient Voltage Recovery Requirement
Bus voltage excursions above 1.20 PU anytime after the fault is cleared (time= T sec) are considered unacceptable.
Fault Cleared at time = T sec
Bus voltage excursions below 0.70 PU anytime after the fault is cleared (time = T sec) are considered unacceptable.

APPENDIX B POWER FACTOR ANALYSIS RESULTS

All the contingency numbers shown in this appendix match with the fault numbers shown in Table 2-1.

C.1 GEN-2016-007 2016 Winter Peak Case

The GEN-2016-007 POI voltage is 1.0107 pu in the provided 2016 winter peak case. Therefore, the power factor requirements for the wind farm were determined to maintain the voltage at 1.0107 pu. The lowest lagging and leading power factors are highlighted in the table below.

Outage No.		MW	Mvar	PF	
System Intact	0	-97.6	23.2	**0.973**	leading
Contingency	1	-97.6	21.8	0.976	leading
Contingency	2	-97.6	16.6	0.986	leading
Contingency	3	-97.6	17.3	0.985	leading
Contingency	4	-97.6	17	0.985	leading
Contingency	5	-97.6	20.1	0.979	leading
Contingency	6	-97.6	22.7	0.974	leading
Contingency	7	-97.6	22.6	0.974	leading
Contingency	8	-97.6	22.8	0.974	leading
Contingency	9	-97.6	21.5	0.976	leading
Contingency	10	-97.6	21.2	0.977	leading
Contingency	11	-97.6	21.2	0.977	leading
Contingency	12	-97.6	21.6	0.976	leading
Contingency	13	-97.6	21.5	0.977	leading
Contingency	14	-97.6	18.4	0.983	leading

Contingency	16	-97.6	18	0.983	leading
Contingency	17	-97.6	22.5	0.974	leading
Contingency	18	-97.6	22.7	0.974	leading
Contingency	19	-97.6	22.2	0.975	leading

C.2 GEN-2016-007 2017 Summer Peak Case

The GEN-2016-007 POI voltage is 1.0011 pu in the provided 2017 summer peak case. Therefore, the power factor requirements for the wind farm were determined to maintain the voltage at 1.0011 pu. The lowest lagging and leading power factors are highlighted in the table below.

Outage No.		MW	Mvar	PF	
System Intact	0	-97.5	23.8	**0.972**	leading
Contingency	1	-97.5	20.7	0.978	leading
Contingency	2	-97.6	15.4	0.988	leading
Contingency	3	-97.6	18.1	0.983	leading
Contingency	4	-97.6	17.9	0.984	leading

Contingency	17	-97.5	22	0.976	leading
Contingency	18	-97.5	21.3	0.977	leading
Contingency	19	-97.5	21.8	0.976	leading

C.3 GEN-2016-007 2025 Summer Peak Case

The GEN-2016-007 POI voltage is 1.0040 pu in the provided 2025 summer peak case. Therefore, the power factor requirements for the wind farm were determined to maintain the voltage at 1.0040 pu. The lowest lagging and leading power factors are highlighted in the table below.

Outage No.		MW	Mvar	PF	
System Intact	0	-97.6	17.9	0.984	leading

APPENDIX C SIMULATION PLOTS FOR STABILITY ANALYSIS

11.18 K: IMPACT OF THE PROPOSED WIND FARM ON THE WOLF CREEK PLANT

Background

A reliable source of offsite power is required by Nuclear Power plants to maintain the defense in depth needed to assure that the health and safety of the public will be protected in the event that a Updated Safety Analysis Report (USAR) Design Basis Event occurs. Loss of Offsite Power is a contributor to core damage frequency. The importance of Offsite Power to safety is the reason why Wolf Creek's Operating License requires that, in the event that Offsite Power can no longer provide the needed power to safety shut the plant down, the plant must begin shutting down within 1 hour, be subcritical within 6 hours, and in cold shutdown within 36 hours. Most, if not all other nuclear plants in the United States were licensed with four or more offsite power lines that feed the plant substations. However, Wolf Creek was licensed with only three 345kV Lines supplying offsite power, making it an outlier in the industry. Additionally, the LaCygne line into Wolf Creek is Wolf Creek's strongest line. Through a search of the Nuclear industry with the help of Electric Power Research Institute (EPRI) and Institute of Nuclear Power Operations (INPO), only Cooper Plant was found to have a Wind Farm on one of its offsite power lines. However, Cooper has five (5) 345kV Transmission lines. When Wolf Creek obtained their license to operate, the line to LaCygne Power Plant from Wolf Creek was a direct connection. It has now been cut into two line segments, which has increased the frequency of loss of the line by 10.8% and failure rate for all LaCygne Line outages by 22.2%. Since the reliability of the LaCygne-Waverly-Wolf Creek line would be further reduced from the original license from either the additional line tap or tying into the existing Waverly Switching, it will be an adverse change. Because it would be an adverse change, it must either be approved by the NRC prior to any modifications to the line or studies must be performed to demonstrate that the cumulative increase (factoring in the existing Waverly Wind Farm along with the proposed new Wind Farm) in the frequency of occurrence of the loss of offsite power must be less than 10% and the increase in the likelihood of a malfunction causing the loss of offsite power must also be less than minimal. In addition to the Nuclear Safety considerations, studies must be performed to determine commercial impacts to the Wolf Creek plant as well.

Required Studies

1. A study must be performed to determine the cumulative effect of the new proposed Wind Farm connection, the additional Generator tie line, and the existing Waverly Wind Farm to quantify the increase in frequency of occurrence of the loss of the ability of the transmission network to supply offsite power and the increase in the likelihood of a malfunction causing the loss of offsite power. If the results are above the allowable Nuclear Regulatory Commission (NRC) guidelines, the addition of the new Wind Farm will require NRC approval prior to

allowing any changes and may come in the form of new licensing requirements. This process typically takes about one (1) year.

Cost:

$100k for the Study

If the study determines that the adverse impact of the new Wind Farm exceeds the NRC allowable, then it will cost an additional $200k for the NRC review process –no assurance of approval.

2. A harmonic study must be performed to ensure that the Wind Farm will not introduce harmonics onto the electrical grid that will negatively impact the performance of Wolf Creek equipment.
   Cost: $100k (assuming results are favorable)
3. System studies to evaluate: 1) The impact of the Wind Farm on the Wolf Creek Generator stability limits; 2) Plant protective relays (including the Reactor Coolant Pump undervoltage and underfrequency protection); 3) Wolf Creek Switchyard voltage impact; 4) Impact on available short circuit; and 5) Specific analysis of the new Out of Step protection. The studies also need to include as a minimum the following conditions: 1) With all 345-kV lines in service and the Wolf Creek unit fully loaded, the system can successfully withstand loss of any one 345-kV line from the Wolf Creek Substation under three-phase fault conditions with the fault cleared in normal clearing sequence; and 2) With all 345-kV lines in service and the Wolf Creek unit fully loaded, the system can successfully withstand loss of any two elements caused by a single phase fault being cleared by back-up breaker operation in back-up clearing sequences.
   Cost: $300K

Operational Considerations

1. Upon the loss of either the Benton or Rose Hill lines or the breakers at LaCygne that feed the line to Wolf Creek are opened, then the Wind Farm output must be reduced to 0 MW.
2. If additional equipment is required for the Wind Farm to mitigate harmonic concerns, a method to monitor the status of the mitigation equipment must be installed and with an agreement to isolate the Wind Farm immediately in the event that the harmonic mitigation equipment is not functional.

Design Requirements

1. The Wind Farm collector sub, generator tie line, and switching station, must be designed, fabricated, constructed, tested, and use performance standards that meet the latest applicable IEEE, ANSI, and NEMA standards
2. The design of all overhead lines must meet or exceed the requirements of the National Electric Safety Code (4) for heavy loading district, Grade B

construction, and is based on a lightning performance of less than one outage per 100 miles per year.

Other

1. Wolf Creek expended a significant amount of man-hours supporting the Waverly Wind Farm Project. In order to reduce the burden on Wolf Creek, a contractor would need to be hired either to manage the project or take over duties of a Wolf Creek Engineer so that the Wolf Creek Engineer could support the project.
   Cost: $250K

Potential additional man-hours expended to coordinate and present to the Southwest Power Pool unique nuclear requirements in support of the transmission network ability to supply reliable offsite power.
