1. EXECUTIVE SUMMARY

S&C Electric Company (S&C) has performed several analyses as part of a Definitive Interconnection System Impact Study, DISIS-2016-001 (Group 1), in response to a request through Southwest Power Pool (SPP) to administer a subsection of Attachment V to the SPP Open Access Transmission Tariff (Tariff). Group 1 consists of seven (7) new generator interconnection requests (GEN-2015-038, GEN-2015-095, GEN-2016-003, GEN-2016-020, GEN-2016-045, GEN-2016-047, and GEN-2016-057).

S&C has performed dynamic stability analysis for Group 1 under Cluster and Stand-Alone (SA) scenarios. The cluster studies were performed using three (3) cluster base cases (2016 Winter Peak (WP), 2017 Summer Peak (SP), and 2025 SP) provided by SPP. In the cluster studies, all seven new interconnection requests and prior-queued projects were studied at 100% of nameplate MW capacity. The standalone studies were performed using three (3) standalone base cases (2016 WP, 2017 SP, and 2025 SP) provided by SPP and by placing an interconnection request into service, one at a time. The in-service interconnection project was dispatched at 100% power and the six (6) out of service interconnection projects were set to zero generation or to its pre-project value if the project is an increase to an existing project or facility. The dynamics stability analysis for the cluster and stand-alone studies indicated that modifications to Generation Interconnection Requests GEN-2016-045 and GEN-2016-057 are needed to avoid low voltage tripping due to certain contingencies during stability simulation. These projects are unique in that they exhibit long generator leads (290-296 miles) and are both comprised of GE 2.3 MW wind turbines. To mitigate the issues observed, multiple solutions were considered (listed below):

1. Adjustment to the LVPL setpoint of the GE 2.3 MW wind turbine model
2. Addition of a second 345 kV transmission line to each project
3. Additional reactive support at the MV (34.5 kV) and HV level (345 kV)

The solutions mentioned above were simulated independent from one another. The results of each simulation are detailed in Section 6.3.

S&C has performed power factor analysis on Group 1 Cluster scenarios. Power factor analysis reported the power factors at the study projects point of interconnection (POI) for all N-1 three-phase contingences and marked the contingency at which the required power factor at the POI of study projects to maintain the voltages at the desired level is beyond the normal required capability (from 0.95 lagging to 0.95 leading) of the studied projects. The power factor requirement for GEN-2015-038, GEN-2015-095, GEN-2016-003, GEN-2016-020, GEN-2016-045, GEN-2016-047, and GEN-2016-057 interconnection requests is from 0.95 lagging to 0.95 leading power factor at the POIs.

S&C has performed an analysis of low wind/low solar irradiance solar conditions for interconnection requests that are renewable energy projects. The low wind/low solar irradiance analysis was performed only under the cluster cases by taking the interconnection generation out of service and determining the Mvar size of a shunt reactor to offset the reactive power generated from the capacitance of the project's transmission lines and collector cables. The shunt reactor Mvars are given in Section 8.

S&C has performed a short-circuit analysis for the 2017 Summer Peak and 2025 Summer Peak under Group 1 Cluster and reported short circuit results at all buses up to five (5) levels away from the POI of the study projects.

2. INTRODUCTION

S&C has performed several analyses as part of a Definitive Interconnection System Impact Study, DISIS-2016-001 (Group 1), in response to a request through the SPP to administer a subsection of Attachment V to the SPP Tariff. Group 1 consist of seven (7) new generator interconnection requests listed in

Table 1 and thirty-one (31) previously queued projects listed in Table 2.

Table 1: Group 1 Generation Interconnection Requests

Project	Size (MW)	Generator Model	Generator Bus(es)	Point of Interconnection (POI)	POI Bus

3. TRANSMISSION SYSTEM AND STUDY AREA

The interconnection requests in Group 1 will interconnect into Oklahoma Gas & Electric (OKGE, Area #524) and Western Farmers Electric Cooperative (WFEC, Area #525).

In addition to Areas #524 and #525, the following areas were monitored also:

- American Electric Power West (AEPW, Area #520)
- Southwestern Public Service (SPS, Area #526)
- Midwest Energy (MIDW, Area #531)
- Sunflower Electric Power Corporation (SUNC, Area #534)
- Westar Energy, Inc. (WERE, Area #536)

4. POWER FLOW BASE CASES

DISIS-2016-001 (Group 1) and prior-queued projects were modeled as aggregated generating units in the base cases from SPP.

Cluster Scenario Base Cases

- **MDWG15-16WP_DIS1601_G01.sav** – 2016 Winter Peak Cluster Base Case for Group 1. New interconnection requests and prior queued projects at 100% output power.
- **MDWG15-17SP_DIS1601_G01.sav** – 2017 Summer Peak Cluster Base Case for Group 1. New interconnection requests and prior queued projects at 100% output power.
- **MDWG15-25SP_DIS1601_G01.sav** – 2025 Summer Peak Cluster Base Case for Group 1. New interconnection requests and prior queued projects at 100% output power.

Stand-Alone Scenario Base Cases

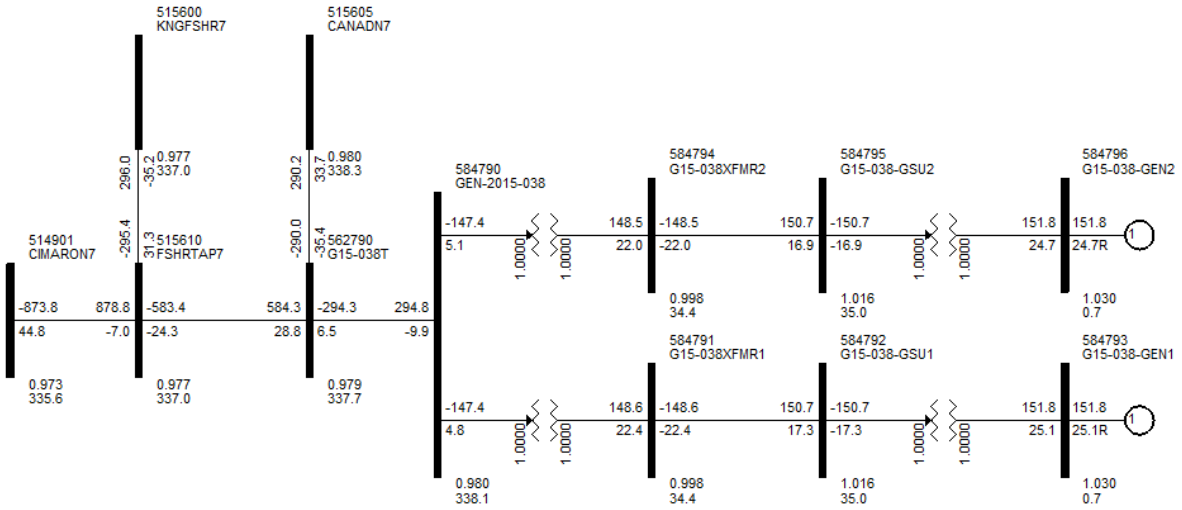
- **MDWG15-16WP_DIS1601_G01_SA.sav** – 2016 Winter Peak SA Base Case for Group 1. New interconnection requests currently out of service.
- **MDWG15-17SP_DIS1601_G01_SA.sav** – 2017 Summer Peak SA Base Case for Group 1. New interconnection requests currently out of service.
- **MDWG15-25SP_DIS1601_G01_SA.sav** – 2025 Summer Peak SA Base Case for Group 1. New interconnection requests currently out of service.

On December 6, 2016, S&C received an IDV file titled "Place_out_of_service_GEN-2011-051-100%_V32.IDV" to remove Prior Queued Project GEN-2011-051 from service.

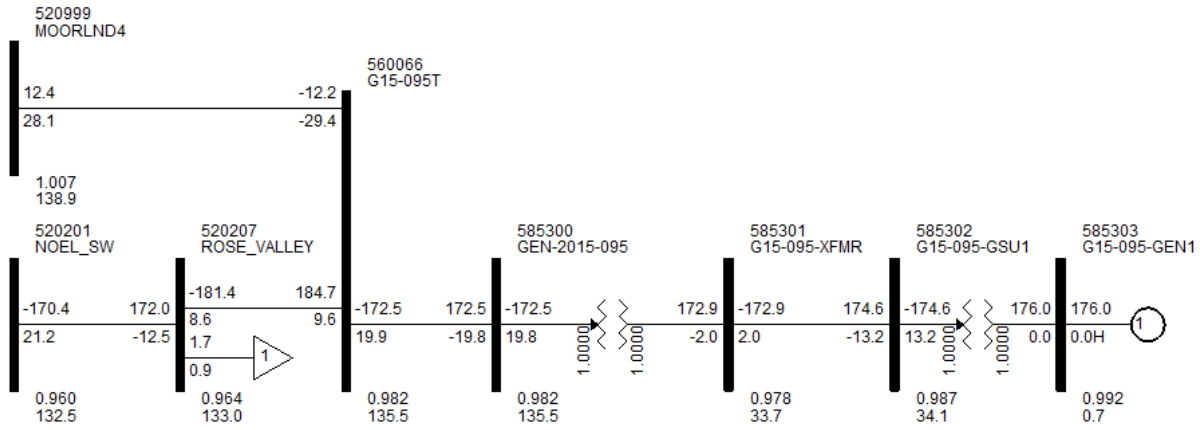
On January 4, 2017, S&C received corrected versions of the IDV files intended to place GEN-2016-047 into service. The revised IDV files were titled "GEN-2016-047-SP_V32_r1.idv" and "GEN-2016-047-WP_V32_r1.idv".

5. POWER FLOW MODEL

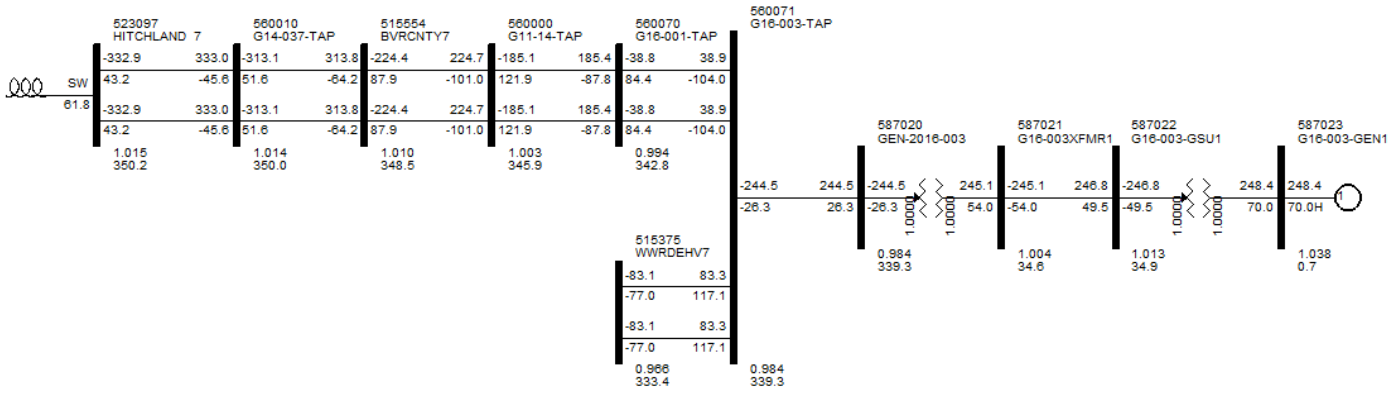
SPP's base case power flow models were built in PSS/E 32.2.1. In PSS/E of the same version, S&C created one-line diagrams depicted in Figure 1 for each interconnection request.



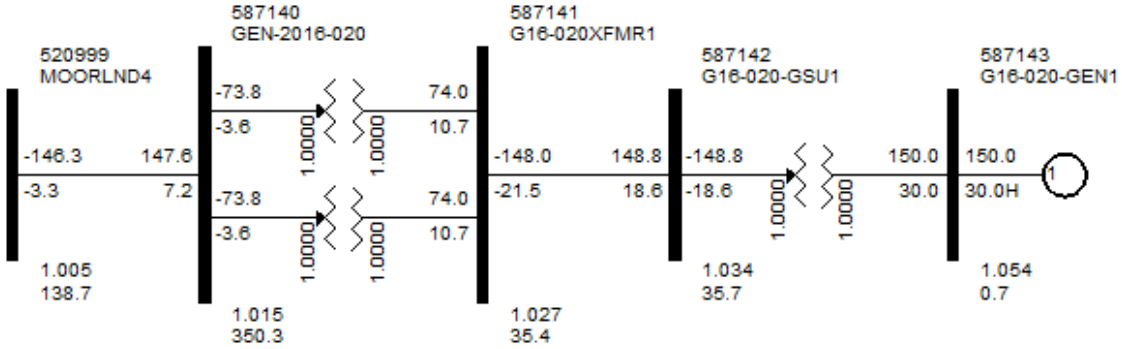
(a) Interconnection request GEN-2015-038



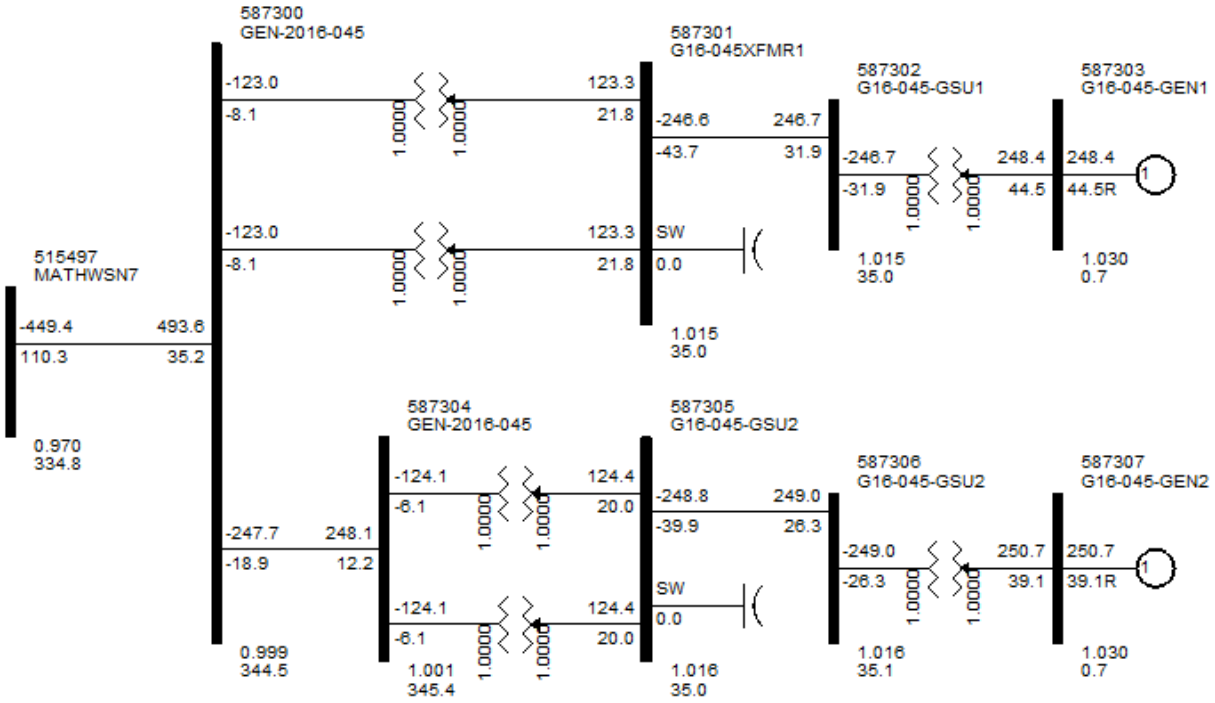
(b) Interconnection request GEN-2015-095



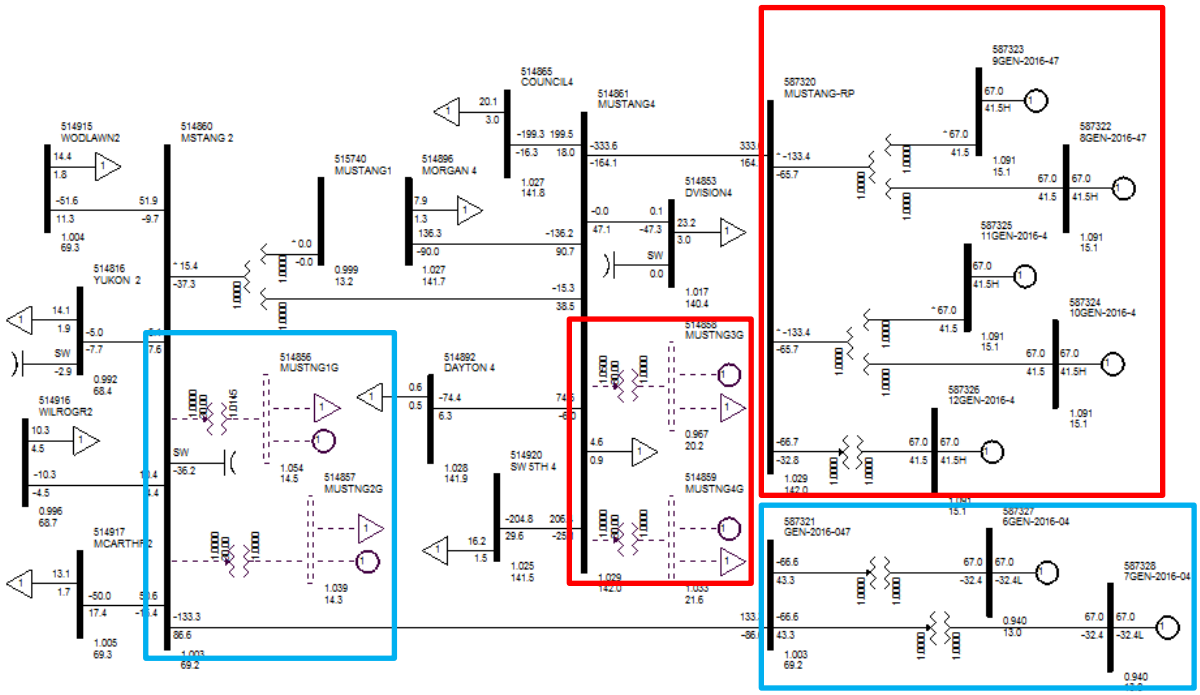
(c) Interconnection request GEN-2016-003



(d) Interconnection request GEN-2016-020

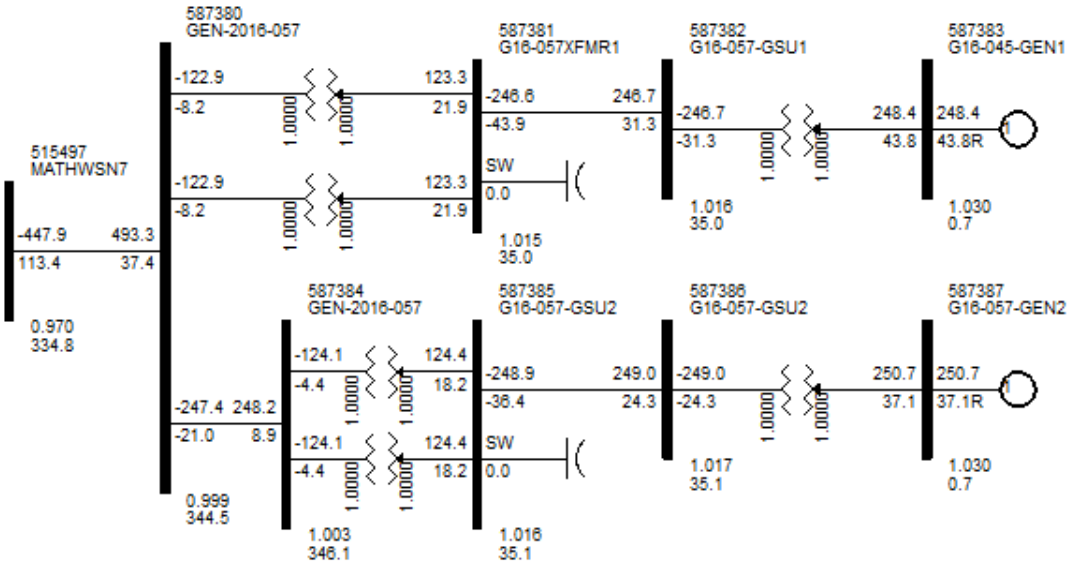


(e) Interconnection request GEN-2016-045



(f) Interconnection request GEN-2016-047

138 kV System in Red: Existing Generation (≈390MW) is dashed & New Generation (335/295MW WP/SP) is solid
Net Result: No 138kV Generation Added
69 kV System in Blue: Existing Generation (≈110MW) is dashed & New Generation (134/118MW WP/SP) is solid
Net Result: Uprate of 24/8MW WP/SP



(g) Interconnection request GEN-2016-057

Note: GEN-2016-057 is the correct naming convention (not GEN-2016-045 as shown above)

Figure 1: One-line Diagrams of the Interconnection Request Projects

6. DYNAMIC STABILITY ANALYSIS

6.1. ASSUMPTIONS

Dynamic stability analysis was performed for all the SPP contingencies listed in Appendix A. Three phase faults were simulated as bolted faults, while single line-to-ground faults were simulated under the assumption that a single line-to-ground fault will cause a 40% drop in the positive-sequence voltage at the fault location.

6.2. STABILITY CRITERIA

Dynamic stability studies were performed to ensure system stability following critical faults on the system. The system is considered stable if the following conditions are met:

(1) Disturbances including three-phase and single-phase to ground faults, should not cause synchronous and asynchronous plants to disconnect from the transmission grid.

(2) The angular positions of synchronous machine rotor become constant following an aperiodic system disturbance.

(3) Voltage magnitudes and frequencies at terminals of asynchronous generators should not exceed magnitudes and durations that will cause protection elements to operate. Furthermore, the response after the disturbance needs to be studied at the terminals of the machine to ensure that there are no sustained oscillations in power output, speed, frequency, etc.

(4) Voltage magnitudes and angles after the disturbance should settle to a constant and acceptable operating level. Frequencies should settle to the acceptable range within nominal 60 Hz power frequency.

In addition, performance of the transmission system is measured against the SPP Disturbance Criteria Requirements on Angular oscillations and Transient Voltage Recovery, detailed in Appendix B.

6.3. DYNAMIC STABILITY RESULTS

Multiple concerns surfaced during preliminary dynamic stability simulations. A detailed list of such concerns and how they were addressed is shown below.

- During the prior outage in FLT64-PO, the system was unable to converge (16WP)
    - To resolve the issue, the control mode of the switched shunt device at bus 599000 was changed from "1 – Discrete, cntr voltage" to "0 – Locked" per SPP direction.
- During the prior outage in FLT76-PO, the system was unable to converge (16WP, 17SP)
    - To resolve the issue in the 16WP case, the reactors located on circuits connected to Woodward 345kV were switched OFF per SPP direction. To resolve the issue in the 17SP case, a larger set of reactor adjustments were made (per SPP direction).
    - The same large set of reactor adjustments was also utilized to resolve the convergence issue encountered during the prior outage in FLT22-PO (17SP)
- Gamesa WTGs at bus 599049 & 599050 tripped on under-voltage during FLT06
    - This issue was also encountered in the previous DISIS-2015-002 GR1 study. In this previous study, SPP provided an IDV file titled "GEN-2006-035_UV_Protection_Modification" to correct an improper implementation of the under-voltage protection scheme for the Gamesa WTGs. The same IDV file was also applied during this study.
- Generation Interconnection Request GEN-2016-041 in Group 2 (involving AE solar inverters) was tripping offline due to overfrequency during FLTs 40-42.
    - This issue was also encountered in the previous DISIS-2015-002 GR7 study. In this previous study, SPP provided an IDV file titled "GEN-2015-055_AEINX_OverFreq_extended.idv" to change the over-frequency parameters. The same IDV file was also applied during this study.
- Generation Interconnection Request GEN-2016-002 in Group 6 (involving Gamesa wind turbines) was tripping due to overvoltage conditions in FLT40.
    - Since this Generation Interconnection Request is far from the area of interest, the GNET command was used at bus 587013 to mitigate the issue.

- When using the revised IDV file titled "GEN-2016-047-SP_V32_r1.idv" to place Generation Interconnection Request GEN-2016-047 into service, the power flow solution failed to converge in the 2025SP case.
    - To resolve the issue, the option "Flat start" was selected within the PSS/E Power Flow solution to encourage convergence. After convergence was achieved, the "Flat start" option was removed.

Dynamic stability simulations were performed once again after implementing the solutions described above. Detailed plots of cluster dynamic stability results for each contingency and each peak season are given in Appendices C-1 to C-3. Plots of stand-alone dynamic stability result for each contingency and each season are given Appendices D-1 to D-21. These results, however, demonstrated that Generation Interconnection Requests GEN-2016-045 and GEN-2016-057 (involving GE 2.3 MW wind turbines) were tripping offline due to low voltage protection. This issue surfaced during multiple contingencies (e.g. FLTs06-20, 72-74, and 82-86). The dynamic stability plots that illustrate these issues are provided in the following Appendices:

- Appendix C-1, C-2 & C-3 (Cluster)
- Appendix D-13, D-14 & D-15 (GEN-2016-045 Stand-Alone)
- Appendix D-19, D-20 & D-21 (GEN-2106-057 Stand-Alone)

Thereafter, SPP suggested changing the J+2 CON parameter of each machine (e.g. 587303, 587307, 587383, and 587387) in GEN-2016-045 and GEN-2016-057 from 0.5 to 0.9 to resolve these issues. This encouraged the Low Voltage Power Logic (LVPL) of the GE turbines to enable during problematic faults. Table 3 below summarizes the new dynamic stability results after this modification. In addition, the revised dynamic stability plots are provided in the following Appendices:

- Appendix C-1-1, C-2-1 & C-3-1 (Cluster)
- Appendix D-13-1, D-14-1 & D-15-1 (GEN-2016-045 Stand-Alone)
- Appendix D-19-1, D-20-1 & D-21-1 (GEN-2106-057 Stand-Alone)

Table 3: Group 1 Dynamic Stability Results

As described by a footnote beneath Table 3, there were some contingencies that resulted in tripping of Generation Interconnection Requests GEN-2016-045 and GEN-2016-057 after the J+2 CON parameter of each machine was changed from 0.5 to 0.9. To resolve this issue, the J+2 CON parameter was reverted back to 0.5. The figure below demonstrates a before/after example of this situation.

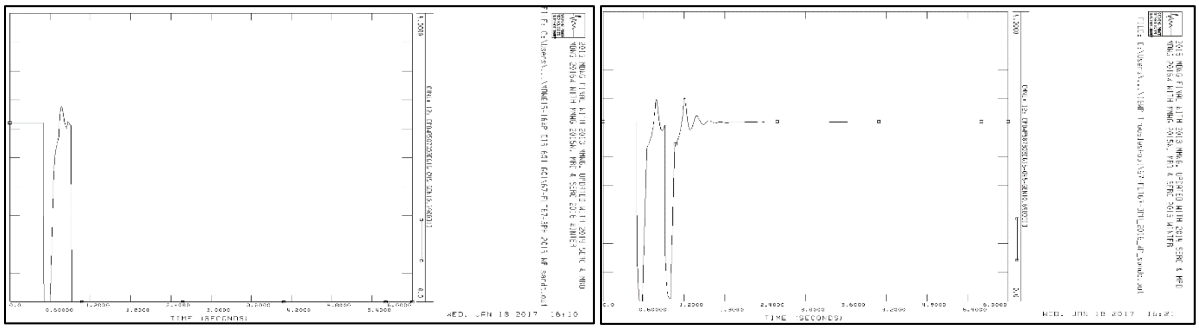

Figure 2: Example of Improved Result with J+2 CON Parameter at 0.5 (GEN-2016-045 Bus #587303 Power)
Left = FLT67 from 2016WP Cluster Case (J+2 CON = 0.9)
Right = FLT67 from 2016WP Cluster Case (J+2 CON = 0.5)

In addition to the item mentioned above, it should be noted that Prior Queued Project GEN-2001-014 occasionally exhibited post-transient voltages greater than 1.1 p.u. during contingencies FLT31, FLT57 & FLT62. However, some form of switching action reduces the voltage when the simulation is extended beyond 20 seconds. The figure below demonstrates an example of when this situation is carried out.

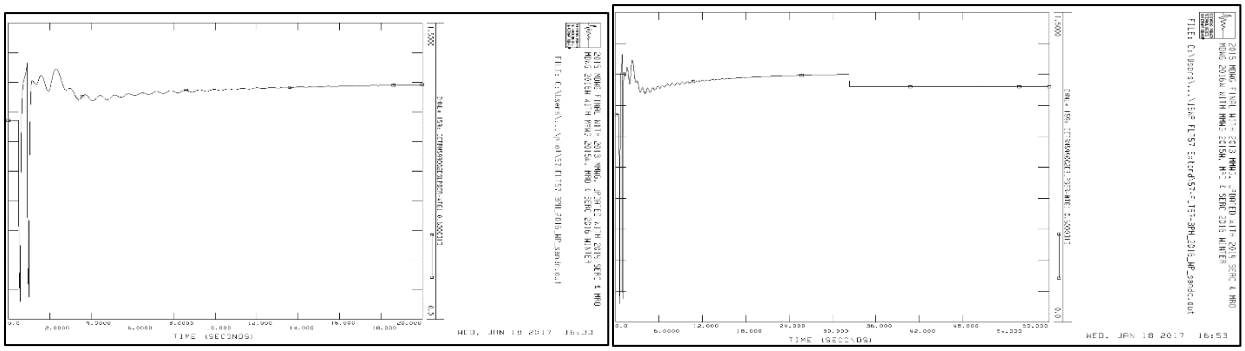

Figure 3: Post-Transient Voltage at Bus #599002 (GEN-2001-014)
Left = 20s simulation (FLT57 in 2016WP Cluster Case)
Right = 60s simulation (FLT57 in 2016WP Cluster Case)

Given the adjustments mentioned, dynamic stability analysis thus concluded that Group 1 experiences improved stability performance when the J+2 CON parameter of each machine (e.g. 587303, 587307, 587383, and 587387) in GEN-2016-045 and GEN-2016-057 is changed from 0.5 to 0.9. However, this is not a viable solution since it is not known what contingency to expect in order to set the J+2 CON to the appropriate value. The wind turbine vendor should be consulted to determine if there are any generator control parameters that can be adjusted to mitigate this issue.

6.3.1. Dynamic Stability Results (Double-Circuit Transmission Lines)

To further support the issues encountered with Generation Interconnection Requests GEN-2016-045 and GEN-2016-057, S&C produced an additional set of dynamic stability plots as listed below:

- Appendices C-1-2, C-2-2 & C-3-2 (Cluster)

The stability plots listed above illustrate the results during the following circumstances:

- Second transmission line added between bus #515497 and bus #587300
- Second transmission line added between bus #515497 and bus #587380
- J+2 CON parameter of GEN-2016-045 and GEN-2016-057 kept at 0.5

These results demonstrate that installing double-circuit transmission lines from each of the generation facilities to the POI serves as an alternative solution for the issues encountered with GEN-2016-045 and GEN-2016-057. These results suggest that the low voltage protection tripping is resolved in each contingency.

It should be noted that initial oscillation issues were observed with Generation Interconnection Request GEN-2015-095 during contingency 24 and Prior Queued Project GEN-2015-081 during contingencies 65 and 74. However, these issues were resolved by adjusting the reactive power capability of the Vestas V110 turbines in Generation Interconnection Request GEN-2015-095 and Prior Queued Projects GEN-2015-048 & GEN-2015-081 (see Figures 4 and 5 below). More specifically, the reactive power capability of each Vestas model was set to a value in a range of 35 to 41 Mvar, such that it yields a power factor of 0.98 ($Q_{GEN} = Q_{MAX} = Q_{MIN}$).

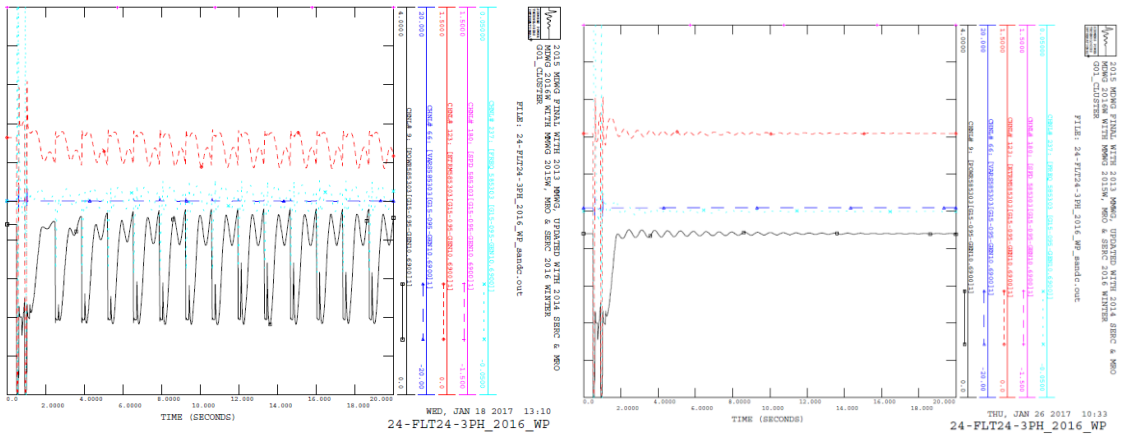

Figure 4: Example of Improved Result with Vestas V110 Adjustment (GEN-2015-095)
Left = FLT24 from 2016WP Cluster Case (Before V110 Adjustment)
Right = FLT24 from 2016WP Cluster Case (After V110 Adjustment)

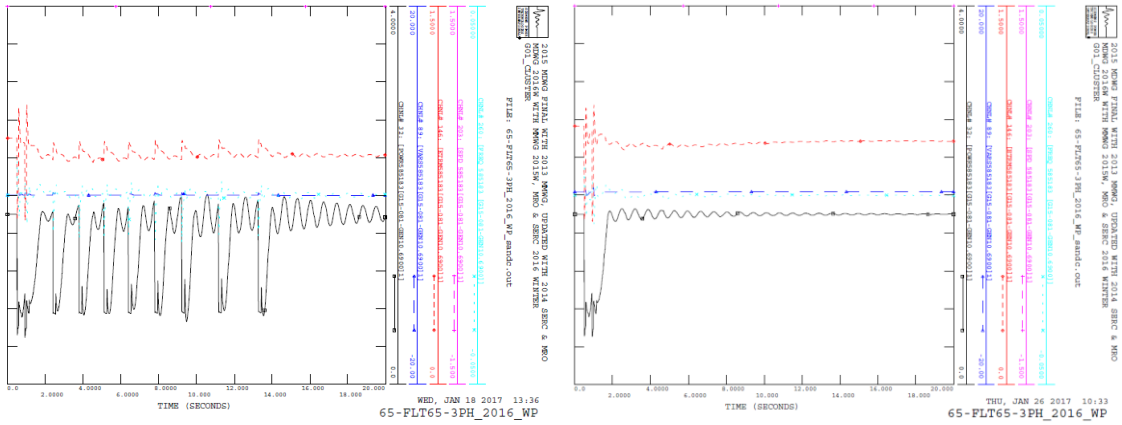

Figure 5: Example of Improved Result with Vestas V110 Adjustment (GEN-2015-081)
Left = FLT65 from 2016WP Cluster Case (Before V110 Adjustment)
Right = FLT65 from 2016WP Cluster Case (After V110 Adjustment)

To confirm that the Vestas V110 adjustment did not introduce new concerns in other contingencies, the dynamic stability plots were revised for the Original cluster cases (Appendices C-1, C-2, and C-3) and the Double-Circuit T-Line cluster cases (Appendices C-1-2, C-2-2, and C-3-2).

6.3.2. Dynamic Stability Results (Additional Reactive Support: MV & HV)

To continue support of the issues encountered with Generation Interconnection Requests GEN-2016-045 and GEN-2016-057, S&C also produced another set of dynamic stability plots as below:

- Appendices C-1-3, C-2-3 & C-3-3 (Cluster)

The stability plots listed above illustrate the results when additional reactive support was provided at the medium-voltage level (34.5 kV). The reactive support took the form of switched shunt devices under various control modes (0 – Locked and 2 – Continuous, cntrl voltage). Various sizes of locked shunt device were tested up to 108 Mvar for GEN-2016-045 and 132 Mvar for GEN-2016-057, as well as ±180 Mvar SVCs. It should be noted that various other changes were also made near GEN-2016-045 and GEN-2016-057 during these simulations (transformer taps, generator bus voltage setpoints, etc.). The results demonstrate that tripping of GEN-2016-045 and GEN-2016-057 was eliminated in some contingencies (e.g. FLTs 06-20 and FLTs 72-74) but not all. In some cases, tripping of GEN-2016-045 and GEN-2016-057 occurred in contingencies that were previously intact (e.g. FLTs 1-5 and FLTs 43-46). For some of these new problematic contingencies, additional generation facilities also tripped offline (e.g. Cuningham machine at bus #527883).

As an alternative to medium-voltage support, additional simulations were also performed with reactive support provided at the high-voltage level (345 kV). More specifically, switched shunt devices were placed at high voltage buses 587300 and 587380. However, the results from these simulations did not show a significant improvement with regards to GEN-2016-045 and GEN-2016-057. For this reason, no additional sets of Appendix C were provided in this situation.

7. Power Factor Analysis

The power factor analysis was performed under the cluster bases and for all N-1 three-phase contingencies shown in the Fault Definition table in Appendix A. Single-phase contingencies, N-1-1 contingencies and N-2 contingencies were excluded from the study. Prior to the run, the cluster base cases were slightly altered, by turning off the renewable energy projects and replacing them by a generator at the high voltage bus with the MW rating of the renewable project at that POI and no var capability. A new var generator was placed at each renewable energy project high voltage bus for supporting the reactive power. The var generators were set to hold the voltage schedule at the interconnection project consistent with the voltage schedules in the provided base case or 1.0 p.u. voltage (whichever is higher).

Table 4 gives the voltage schedule at each interconnection request location in the original cluster base cases.

Table 4: Base Case Voltages at the Interconnection Request POI Bus

Request	POI	2016 Winter Peak (p.u.)	2017 Summer Peak (p.u.)	2025 Summer Peak (p.u.)
GEN-2015-038	514901	0.974	0.984	0.987
GEN-2015-095	560066	0.982	0.978	0.979
GEN-2016-003	560071	0.984	0.986	0.994
GEN-2016-020	520999	1.007	1.005	1.006
GEN-2016-045	515497	0.972	0.982	0.987
GEN-2016-047	514860	1.004	1.001	1.000
GEN-2016-057	515497	0.972	0.982	0.987

The power factor analysis results for Group 1 interconnection requests for each N-1 three phase contingency were presented in Appendix E. We marked in pink color the contingencies at which the required power factor at the POI of the study project is beyond the normal required capability (from 0.95 lagging to 0.95 leading) of the studied renewable energy project. We also provided a summary Table 5 of the maximum leading/lagging reactive power demand and power factor found by the power factor analysis at the POIs.

The power factor requirement for GEN-2015-038, GEN-2015-095, GEN-2016-003, GEN-2016-020, GEN-2016-045, GEN-2016-047, and GEN-2016-057 interconnection requests is from 0.95 lagging to 0.95 leading power factor at the POIs.

Table 5: Summary of Power Factor Analysis at the POI

Request	Capacity	POI	Reactive Power/Power Factor at the POI	
			Leading (absorbing vars)	Lagging (providing vars)
GEN-2015-038	303.6 MW	514901	N/A**	455.1 Mvar / 0.892**
GEN-2015-095	176 MW	560066	-26.9 Mvar / 0.989	40.0 Mvar / 0.975
GEN-2016-003	248.4 MW	560071	-8.4 Mvar / 0.999	585.5 Mvar / 0.391
GEN-2016-020	150 MW	520999	-61.3 Mvar / 0.924	74.6 Mvar / 0.893
GEN-2016-045	500 MW	515497	-57.6 Mvar / 0.992	98.6 Mvar / 0.978
GEN-2016-047	118/134MW SP/WP	514860	-*	-*
GEN-2016-057	500 MW	515497	-63.8 Mvar / 0.990	103.0 Mvar / 0.976

** GEN-2016-047 is not a renewable energy project (combustion turbine) and is therefore not included*

*** Note that GEN-2015-038 has the same POI bus (514901) as prior-queued projects Gen-2010-040 and Gen-2011-054. The aggregated MW of these three (3) generators is 902.1 MW at the high-side bus downstream of the POI.*

NOTE: Per the SPP Tariff as reactive power is required for all projects, the final requirement in the GIA will be the pro-forma 95% lagging to 95% leading at the point of interconnection.

8. Low Wind/Low Solar irradiance Conditions Analysis

S&C has performed an analysis of low wind/low solar irradiance conditions for the interconnection requests that is a renewable energy project. The low wind/low solar irradiance analysis was performed under the Cluster scenarios by taking the interconnection renewable energy project out of service and placing a shunt reactor at the project substation high side to offset the reactive power generated from the capacitance of the project's transmission lines and collector cables. The size of the shunt reactor was adjusted such that the net Mvar flow into the POI from the studied renewable energy project was approximately zero. Table 6 gives the shunt reactor Mvars for the studied projects.

Table 6: Shunt Reactor Mvar Determined by Low Wind/Low Irradiance Study

Request	POI	2016 Winter Peak	2017 Summer Peak	2025 Summer Peak
GEN-2015-038**	514901	25.3	25.3	25.3
GEN-2015-095	560066	14.6	14.6	14.6
GEN-2016-003	560071	6.7	6.7	6.7
GEN-2016-020	520999	3.9	3.9	3.9
GEN-2016-045	515497	317.5	317.5	317.5
GEN-2016-047	514860	-*	-*	-*
GEN-2016-057	515497	333.0	333.0	333.0

** GEN-2016-047 is not a renewable energy project (combustion turbine) and is therefore not included*

*** The POI for GEN-2015-038 is the Cimarron 345 kV (514901). However, GEN-2015-038 will share the transmission line of prior queued projects GEN-2010-040 and GEN-2011-054. This table shows the reactor requirement attributed to GEN-2015-038 up to the point where it connects to the shared transmission line.*

9. SHORT-CIRCUIT STUDY

A short-circuit study has been performed on the power flow models for the 2017 SP and 2025 SP Seasons for each generator using the Cluster Scenario model. Short-circuit analysis includes applying a 3-phase fault on buses up to 5 levels away from the POI of each interconnection request project. PSS/E "Automatic Sequence Fault Calculation (ASCC)" fault analysis module was used for the purpose of short-circuit analysis. The results of the short-circuit analysis have been recorded for all the buses up to five levels away from the point of interconnection of each interconnection request project. Detailed results of the short-circuit study are provided in Appendix F.

10. CONCLUSIONS AND RECOMMENDATIONS

Analysis of Group 1 dynamic simulation results revealed that Generation Interconnection Requests GEN-2016-045 and GEN-2016-057 tripped offline for multiple contingencies in the Cluster cases (16WP, 17SP, and 25SP) and Stand-Alone cases (16WP, 17SP, and 25SP). To address these issues, multiple solutions were considered (listed below):

1. Adjustment to the LVPL setpoint of the GE 2.3 MW wind turbine model
2. Addition of a second 345 kV transmission line to each project
3. Additional reactive support at the MV (34.5 kV) and HV level (345 kV)

While option #2 (double transmission line) resolved the issue in all contingencies, it could also prove to be the most expensive option. For this reason, additional consideration should be given to options #1 and #3 (although these options did not resolve the issue in every contingency). To help support the process of evaluating each option, S&C has provided multiple sets of dynamic stability plots within Appendix C. It is recommended that further detailed studies be performed to determine the size and type of the reactive compensation system as a possible solution. Detailed model of the wind farms and comprehensive dynamic model of the RCS shall be utilized for such studies, which is beyond the scope of this project.

The results of power factor analysis indicate that all the interconnection requests are required to maintain a power factor of 0.95 lagging to 0.95 leading at the POI to meet SPP's requirements.

The project's low wind/low solar irradiance study suggested that to offset the reactive power from the capacitance of the project's transmission lines and collector cables during the low wind/low irradiance conditions, a 25.3 Mvar shunt reactor size is required for GEN-2015-038, 14.6 Mvar for GEN-2015-095, 6.7 Mvar for GEN-2016-003, 3.9 Mvar for GEN-2016-020, 317.5 Mvar for GEN-2016-045, and a 333.0 Mvar for GEN-2016-057.

A short-circuit study has been performed on the power flow models for the 2017 Summer Peak Season and 2025 Summer Peak Season for each generator using the Cluster Scenario model. A 3-phase fault is applied on buses up to 5 levels away from the POI of each interconnection request project and the results of the study have been presented.

APPENDIX A

SPP GROUP 1 FAULT DEFINITIONS

Fault Definitions

Cont. No.	Cont. Name	Description
1	FLT01-3PH	3 phase fault on CIMARON7 345 kV (514901) to MATHWSN7 345 kV (515497) CKT 1, near CIMARON7. a. Apply fault at the CIMARON7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
2	FLT02-3PH	3 phase fault on CIMARON7 345 kV (514901) to NORTWST7 345 kV (514880), near CIMARON7. a. Apply fault at the CIMARON7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
3	FLT03-3PH	3 phase fault on CIMARON7 345 kV (514901) to MINCO 7 345 kV (514801), near CIMARON7. a. Apply fault at the CIMARON7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
4	FLT04-3PH	3 phase fault on CIMARON7 345 kV (514901) to DRAPER 7 345 kV (514934), near CIMARON7. a. Apply fault at the CIMARON7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
5	FLT05-3PH	3 phase fault on the CIMARON7 345 kV (514901) to CIMARON4 138 kV (514898) to CIMARO11 13.8 kV (515714) XFMR, near CIMARON7 345 kV. a. Apply fault at the CIMARON7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted transformer.
6	FLT06-3PH	3 phase fault on MINCO 7 345 kV (514801) to GRACMNT7 345 kV (515800), near MINCO 7. a. Apply fault at the MINCO 7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Fault Definitions

Cont. No.	Cont. Name	Description
7	FLT07-3PH	3 phase fault on DRAPER 7 345 kV (514934) to SEMINOL7 345 kV (515045) CKT1, near DRAPER 7. a. Apply fault at the DRAPER 7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
8	FLT08-3PH	3 phase fault on the DRAPER 7 345 kV (514934) to DRAPER 4 138 kV (514933) to DRAPER31 13.8 kV (515720) XFMR, near DRAPER 7 345 kV. a. Apply fault at the DRAPER 7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted transformer.
9	FLT09-3PH	3 phase fault on CIMARON4 138 kV (514898) to EL-RENO4 138 kV (514819), near CIMARON4. a. Apply fault at the CIMARON4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
10	FLT10-3PH	3 phase fault on CIMARON4 138 kV (514898) to TUTCONT4 138 kV (511425), near CIMARON4. a. Apply fault at the CIMARON4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
11	FLT11-3PH	3 phase fault on CIMARON4 138 kV (514898) to JENSENT4 138 kV (514820), near CIMARON4. a. Apply fault at the CIMARON4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
12	FLT12-3PH	3 phase fault on CIMARON4 138 kV (514898) to SARA 4 138 kV (514895), near CIMARON4. a. Apply fault at the CIMARON4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Fault Definitions

Cont. No.	Cont. Name	Description
13	FLT13-3PH	3 phase fault on CIMARON4 138 kV (514898) to CZECHAL4 138 kV (514894), near CIMARON4. a. Apply fault at the CIMARON4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
14	FLT14-3PH	3 phase fault on CIMARON4 138 kV (514898) to HAYMAKR4 138 kV (514863), near CIMARON4. a. Apply fault at the CIMARON4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
15	FLT15-SB	**Stuck Breaker at CIMARON7 (514901)** a. Apply single phase fault at CIMARON7 bus. b. Clear fault after 16 cycles and trip the following elements c. CIMARON7 (514901) - NORTWST7 (514880) d. CIMARON7 (514901) - DRAPER 7 (514934)
16	FLT16-SB	**Stuck Breaker at CIMARON7 (514901)** a. Apply single phase fault at CIMARON7 bus. b. Clear fault after 16 cycles and trip the following elements c. CIMARON7 (514901) - MINCO 7 (514801) d. CIMARON7 345kV (514901) / CIMARON4 138 kV (514898) / CIMARO11 13.8 kV (515714) transformer
17	FLT17-SB	**Stuck Breaker at CIMARON7 (514901)** a. Apply single phase fault at CIMARON7 bus. b. Clear fault after 16 cycles and trip the following elements c. CIMARON7 (514901) - MATHWSN7 (515497), CKT 1 d. CIMARON7 (514901) - NORTWST7 (514880)
18	FLT18-SB	**Stuck Breaker at CIMARON7 (514901)** a. Apply single phase fault at CIMARON7 bus. b. Clear fault after 16 cycles and trip the following elements c. CIMARON7 (514901) - MATHWSN7 (515497), CKT 1 d. CIMARON7 (514901) - MINCO 7 (514801)
19	FLT19-SB	**Stuck Breaker at CIMARON7 (514901)** a. Apply single phase fault at CIMARON7 bus. b. Clear fault after 16 cycles and trip the following elements c. CIMARON7 (514901) - MATHWSN7 (515497), CKT 1 d. CIMARON7 (514901) - DRAPER 7 (514934)

Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
73	FLT73-SB	**Stuck Breaker at MATHWSN7 (515497)** a. Apply single phase fault at MATHWSN7. b. Clear fault after 16 cycles and trip the following elements c. MATHWSN7 (515497) - NORTWST7 (514880) d. MATHWSN7 (515497) - CIMARON7 (514901), CKT 1
74	FLT74-SB	**Stuck Breaker at MATHWSN7 (515497)** a. Apply single phase fault at MATHWSN7. b. Clear fault after 16 cycles and trip the following elements c. MATHWSN7 (515497) - TATONGA7 (515407), CKT 1 d. MATHWSN7 (515497) - G15-063T (560055)
75	FLT75-PO	**Prior Outage of MATHWSN7 (515497) to NORTWST7 (514880) line;** 3 phase fault on MATHWSN7 (515497) - CIMARON7 (514901), CKT 1 near MATHWSN7 a. Apply fault at the MATHWSN7 bus. b. Clear fault after 5 cycles and trip the faulted line.
76	FLT76-PO	**Prior Outage of MATHWSN7 (515497) to TATONGA7 (515407) CKT 1;** 3 phase fault on MATHWSN7 (515497) - G15-063T (560055) near MATHWSN7 a. Apply fault at the MATHWSN7 bus. b. Clear fault after 5 cycles and trip the faulted line.
77	FLT77-3PH	3 phase fault on MSTANG 2 69 kV (514860) to YUKON 2 69 kV (514816), near MSTANG 2. a. Apply fault at the MSTANG 2 69 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Fault Definitions

Cont. No.	Cont. Name	Description
78	FLT78-3PH	3 phase fault on MSTANG 2 69 kV (514860) to MCARTHR2 69 kV (514917), near MSTANG 2. a. Apply fault at the MSTANG 2 69 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
79	FLT79-3PH	3 phase fault on MSTANG 2 69 kV (514860) to MUSTANG4 138 kV (514861) to MUSTANG1 13.2 kV (515740) XFMR, near MSTANG 2 69 kV. a. Apply fault at the MSTANG 2 69 kV bus. b. Clear fault after 5 cycles and trip the faulted transformer.
80	FLT80-3PH	3 phase fault on MSTANG 2 69 kV (514860) to WODLAWN2 69 kV (514915), near MSTANG 2. a. Apply fault at the MSTANG 2 69 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
81	FLT81-3PH	3 phase fault on YUKON 2 69 kV (514816) to SVCELRN2 69 kV (514817), near YUKON 2. a. Apply fault at the YUKON 2 69 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
82	FLT82-3PH	3 phase fault on MUSTANG4 138 kV (514861) to DVISION4 138 kV (514853), near MUSTANG4. a. Apply fault at the MUSTANG4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
83	FLT83-3PH	3 phase fault on MUSTANG4 138 kV (514861) to MORGAN 4 138 kV (514896), near MUSTANG4. a. Apply fault at the MUSTANG4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Fault Definitions

Cont. No.	Cont. Name	Description
84	FLT84-3PH	3 phase fault on MUSTANG4 138 kV (514861) to COUNCIL4 138 kV (514865), near MUSTANG4. a. Apply fault at the MUSTANG4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
85	FLT85-3PH	3 phase fault on MUSTANG4 138 kV (514861) to DAYTON 4 138 kV (514892), near MUSTANG4. a. Apply fault at the MUSTANG4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
86	FLT86-3PH (16WP & 17SP ONLY)	3 phase fault on MUSTANG4 138 kV (514861) to SW 5TH 4 138 kV (514920), near MUSTANG4. a. Apply fault at the MUSTANG4 138 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
87	FLT87-3PH	3 phase fault on WODLAWN2 69 kV (514915) to BETHANY2 69 kV (514914), near WODLAWN2. a. Apply fault at the WODLAWN2 69 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
88	FLT88-SB	**Stuck Breaker at MSTANG 2 (514860)** a. Apply single phase fault at MSTANG 2. b. Clear fault after 16 cycles and trip the following elements c. MSTANG 2 (514860) - YUKON 2 (514816) d. MSTANG 2 69 kV (514860) / MUSTANG4 138 kV (514861) / MUSTANG1 13.2 kV (515740) transformer
89	FLT89-SB	**Stuck Breaker at MSTANG 2 (514860)** a. Apply single phase fault at MSTANG 2. b. Clear fault after 16 cycles and trip the following elements c. MSTANG 2 (514860) - MCARTHR2 (514917) d. MSTANG 2 (514860) - WODLAWN2 (514915)

Fault Definitions

Cont. No.	Cont. Name	Description
90	FLT90-PO	**Prior Outage of MSTANG 2 (514860) to YUKON 2 (514816) line;** 3 phase fault on MSTANG 2 69 kV (514860) / MUSTANG4 138 kV (514861) / MUSTANG1 13.2 kV (515740) transformer near MSTANG 2 a. Apply fault at the MSTANG 2 bus. b. Clear fault after 5 cycles and trip the faulted transformer.
91	FLT91-PO	**Prior Outage of MSTANG 2 (514860) to MCARTHR2 (514917) line;** 3 phase fault on MSTANG 2 (514860) - WODLAWN2 (514915) near MSTANG 2 a. Apply fault at the MSTANG 2 bus. b. Clear fault after 5 cycles and trip the faulted line.

APPENDIX B

SOUTHWEST POWER POOL DISTURBANCE PERFORMANCE REQUIREMENTS (SUBMITTED IN A SEPARATE FILE)

APPENDIX C

DYNAMIC STABILITY PLOTS FOR CLUSTER SCENARIO (SUBMITTED IN SEPARATE FILES FROM APPENDIX C-1 TO C-3)

C-1 Group 1 Cluster Dynamic Stability Plots For 2016 Winter Peak Case

C-1-1 Group 1 Cluster Dynamic Stability Plots For 2016 Winter Peak Case (J+2 CON)

C-1-2 Group 1 Cluster Dynamic Stability Plots For 2016 Winter Peak Case (Double T-Line)

C-1-3 Group 1 Cluster Dynamic Stability Plots For 2016 Winter Peak Case (Reactive Support)

C-2 Group 1 Cluster Dynamic Stability Plots For 2017 Summer Peak Case

C-2-1 Group 1 Cluster Dynamic Stability Plots For 2017 Summer Peak Case (J+2 CON)

C-2-2 Group 1 Cluster Dynamic Stability Plots For 2017 Summer Peak Case (Double T-Line)

C-2-3 Group 1 Cluster Dynamic Stability Plots For 2017 Summer Peak Case (Reactive Support)

C-3 Group 1 Cluster Dynamic Stability Plots For 2025 Summer Peak Case

C-3-1 Group 1 Cluster Dynamic Stability Plots For 2025 Summer Peak Case (J+2 CON)

C-3-2 Group 1 Cluster Dynamic Stability Plots For 2025 Summer Peak Case (Double T-Line)

C-3-3 Group 1 Cluster Dynamic Stability Plots For 2025 Summer Peak Case (Reactive Support)

Each contingency consists of (66) subplots:

- Subplot #1 is the system phase angle channels in the snapshot file provided by SPP.
- Subplot #2 to Subplot #58 are results for (57) generators in the scope of study.
- Subplots #59 to Subplot #62 are voltages at the POI buses in the scope of study.
- Subplots #63 to Subplot #66 are frequencies at the POI buses in the scope of study.

APPENDIX D

DYNAMIC STABILITY PLOTS FOR STAND-ALONE SCENARIO (SUBMITTED IN SEPARATE FILE FROM APPENDIX D-1 TO D-21)

D-1 Group1 StandAlone "GEN-2015-038" Stability Plots For 2016 Winter Peak Case
D-2 Group1 StandAlone "GEN-2015-038" Stability Plots For 2017 Summer Peak Case

1 Executive Summary

As the Regional Transmission Operator, Southwest Power Pool (SPP) is responsible for conducting a Definitive Impact Study for its interconnection customers. The customers in DISIS-2016-001 (Group 02) have requested a generation interconnection study through SPP for their respective interconnection requests. SPP contracted Power Systems Consultants (PSC) to carry out this definitive interconnection system impact study (DISIS), which includes the projects listed in Table 1.

Table 1: Generation Interconnection Requests Group 02

Request	Size (MW)	Wind Turbine Model	Point of Interconnection
GEN-2015-082	200.0	GE 2.0MW	Tap on Woodward (515375) to Beaver (515554) 345kV (G11-14-TAP, 560000)
GEN-2016-001	300.3	Vestas GS V126 3.3MW	Tap on Badger (G11-14-TAP, 560000) to Woodward (515375) 345kV (560070)
GEN-2016-038	299	GE 2.3MW	Harrington 230kV (523978)
GEN-2016-041	100	Advanced Energy 500NX 0.5MW PV inverters	Hitchland 345kV (523097)
GEN-2016-059	299	GE 2.3MW	Harrington 230kV (523978)
GEN-2016-070	5.3MW Uprate (Total 84.8MW)	GE 1.6MW	Martin Switching Station 115kV (523928)

The definitive impact studies include short circuit analysis, stability analysis, reactive analysis and power factor analysis.

The following base cases were provided by SPP to perform the impact studies:

MDWG15-16WP_DIS1601_G02– 2016 winter peak base case

MDWG15-17SP_DIS1601_G02– 2017 summer peak base case

MDWG15-25SP_DIS1601_G02– 2025 summer peak base case

However, the following network upgrades were added to the original base cases on SPP's recommendation to mitigate voltage collapse issues for certain N-1 contingencies observed in the cluster base cases:

- Potter County to Grapevine to Chisholm 345kV circuit 1
- Grapevine to Beaver County 345kV circuit 1
- Beaver County to Clark County 345kV circuit 1

- Accelerate Woodward to Mathewson 345kV circuit 2 (added to 2016 WP and 2017 SP only)

These upgrades were added to the cluster and standalone base cases prior to performing the studies.

1.1 Cluster power factor analysis

A power factor analysis for each generation project was performed on the 2016 winter peak, 2017 summer peak, and 2025 summer peak cases with identified system upgrades. As reactive power is required for all projects, the final requirement per the SPP Open Access Transmission Tariff (OATT) will be the pro-forma 95% lagging to 95% leading at the point of interconnection.

A low wind/no wind (low irradiance/no irradiance) analysis was performed on both wind powered and solar powered generation projects. This analysis determines the amount reactors needed to offset the capacitive injection as a result of the charging in the transmission lead from the project to the Point of Interconnection (POI) and the charging in the collector system while the project is on line but producing little or no power.

1.2 Cluster Short-circuit analysis

Short-circuit current levels were calculated for all transmission buses (rated at 115 kV and above) within five buses away from the POI of all the cluster generators. The total short circuit currents at the mentioned buses are within the typical range of the breaker duty requirements and the short circuit current contribution from requested project is not anticipated to impact breaker duty requirements.

1.3 Cluster dynamic scenario

One hundred and ninety-one contingencies were simulated for the 2016 winter peak and 2017 summer peak base cases, and one hundred and ninety-two contingencies were simulated for the 2025 summer peak base case. The contingencies simulated include single phase, three phase and single phase stuck breaker faults and three phase faults with a prior outage branch.

A number of contingencies resulted in system instability, which led to the loss of prior queue and requested generation. Mitigation measures were required to enable system stability following these contingencies. The prior queue and requested projects that were impacted by post contingency system instability are as follows:

Project GEN-2016-041: Over-frequency tripping

Project GEN-2016-038: Under-voltage tripping (In 2017SP scenario only)

Project GEN-2016-059: Under-voltage tripping (In 2017SP scenario only)

Prior project GEN-2006-044: Over-voltage tripping

Prior project ASGI-2011-002: Over-voltage tripping

Mitigation measures that were tested include the following:

- Correct the over-voltage protection thresholds and time delay settings for GEN-2006-044 and ASGI-2011-002
- Modify the over-frequency protection threshold and time delay settings for GEN-2016-041
- Add dynamic reactive power support on the 34.5 kV collector buses of GEN-2016-038 and GEN-2016-059

With the mitigation measures applied:

- Group 02 generators (as listed in Table 2) are able to ride through all the simulated contingencies and the transient recovery voltage at the Points of Interconnection (POIs) remains within 0.7 to 1.2 per unit (pu) following fault clearance (as per SPP Disturbance Performance Requirements);
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations (as per SPP Disturbance Performance Requirements) occur for the synchronous generators in the monitored areas;
- The projects were found to comply with the low voltage ride through requirements in FERC Order 661A.

1.4 Standalone dynamic scenario, GEN-2015-082

Seventy-three contingencies were simulated for each of the three base cases: 2016 winter peak, 2017 summer peak, and 2025 summer peak.

A number of contingencies resulted in system instability, which led to the loss of prior queue generation. Mitigation measures were required to enable system stability following these contingencies. The prior queue projects that were impacted by post contingency system instability are as follows:

- Prior project GEN-2006-044: Over-voltage tripping
- Prior project ASGI-2011-002: Over-voltage tripping

Mitigation measures that were tested include the following:

- Correct the over-voltage protection settings for GEN-2006-044
- Correct the over-voltage protection for ASGI-2011-002

With the mitigation measures applied:

- The transient recovery voltage at the Point of Interconnection (POI) remains within 0.7 to 1.2 per unit (pu) following fault clearance (as per SPP Disturbance Performance Requirements);
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations (as per SPP Disturbance Performance Requirements) occur for the synchronous generators in the monitored areas;

1.5 Standalone dynamic scenario, GEN-2016-001

Seventy-four contingencies were simulated for each of the three base cases: 2016 winter peak, 2017 summer peak, and 2025 summer peak.

A number of contingencies resulted in system instability, which led to the loss of prior queue generation. Mitigation measures were required to enable system stability following these contingencies. The prior queue projects that were impacted by post contingency system instability are as follows:

- Prior project GEN-2006-044: Over-voltage tripping
- Prior project ASGI-2011-002: Over-voltage tripping

Mitigation measures that were tested included one or more of the following:

- Correct the over-voltage protection settings for GEN-2006-044
- Correct the over-voltage protection for ASGI-2011-002

With the mitigation measures applied:

- The transient recovery voltage at the Point of Interconnection (POI) remains within 0.7 to 1.2 per unit (pu) following fault clearance (as per SPP Disturbance Performance Requirements);
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations (as per SPP Disturbance Performance Requirements) occur for the synchronous generators in the monitored areas;

1.6 Standalone dynamic scenario, GEN-2016-038

Twenty-one contingencies were simulated for each of the three base cases: 2016 winter peak, 2017 summer peak, and 2025 summer peak.

A number of contingencies resulted in system instability, which led to the loss of GEN-2016-038 and prior queue generation. Mitigation measures were required to enable system stability

following these contingencies. The requested and prior queue projects that were impacted by post contingency system instability are as follows:

- Prior project GEN-2006-044: Over-voltage tripping
- Prior project ASGI-2011-002: Over-voltage tripping
- Project GEN-2016-038: Under-voltage tripping

Mitigation measures that were tested include the following:

- Modify over-voltage protection settings for GEN-2006-044 and ASGI-2011-002
- Add dynamic reactive power support on the 34.5 kV collector buses of GEN-2016-038

With the mitigation measures applied:

- GEN-2016-038 is able to ride through all the simulated contingencies and the transient recovery voltage at the POI remains within a 0.7 to 1.2 pu range following fault clearance;
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations (as per SPP Disturbance Performance Requirements) occur for the synchronous generators in the monitored areas;

1.7 Standalone dynamic scenario, GEN-2016-041

Forty-five contingencies were simulated for each of the three base cases: 2016 winter peak, 2017 summer peak, and 2025 summer peak.

A number of contingencies resulted in system instability, which led to the loss of GEN-2016-041 and prior queue generation. Mitigation measures were required to enable system stability following these contingencies. The requested and prior queue projects that were impacted by post contingency system instability are as follows:

- Prior project GEN-2006-044: Over-voltage tripping
- Prior project ASGI-2011-002: Over-voltage tripping
- Project GEN-2016-041: Over-frequency tripping

Mitigation measures that were tested include the following:

- Correct the over-voltage protection settings for GEN-2006-044 and ASGI-2011-002

- Modify the over-frequency protection threshold and time delay settings for GEN-2016-041

With the mitigation measures applied:

- GEN-2016-041 is able to ride through all the simulated contingencies and the transient recovery voltage at the POI remains within a 0.7 to 1.2 pu range following fault clearance;
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations (as per SPP Disturbance Performance Requirements) occur for the synchronous generators in the monitored areas;

1.8 Standalone dynamic scenario, GEN-2016-059

Twenty-one contingencies were simulated for each of the three base cases: 2016 winter peak, 2017 summer peak, and 2025 summer peak.

A number of contingencies resulted in system instability, which led to the loss of GEN-2016-059 and prior queue generation. Mitigation measures were required to enable system stability following these contingencies. The requested and prior queue projects that were impacted by post contingency system instability are as follows:

- Prior project GEN-2006-044: Over-voltage tripping
- Prior project ASGI-2011-002: Over-voltage tripping
- Project GEN-2016-059: Under-voltage tripping

Mitigation measures that were tested include the following:

- Correct the over-voltage protection settings for GEN-2006-044 and ASGI-2011-002
- Add dynamic reactive power support at the 34.5 kV collector buses of GEN-2016-059

With the mitigation measures applied:

- GEN-2016-059 is able to ride through all the simulated contingencies and the transient recovery voltage at the POI remains within a 0.7 to 1.2 pu range following fault clearance;
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations (as per SPP Disturbance Performance Requirements) occur for the synchronous generators in the monitored areas;

1.9 Standalone dynamic scenario, GEN-2016-070

Seventeen contingencies were simulated for each of the three base cases: 2016 winter peak, 2017 summer peak, and 2025 summer peak.

A number of contingencies resulted in system instability, which led to the loss of prior queue generation. Mitigation measures were required to enable system stability following these contingencies. The prior queue projects that were impacted by post contingency system instability are as follows:

- Prior project GEN-2006-044: Over-voltage tripping
- Prior project ASGI-2011-002: Over-voltage tripping

Mitigation measures that were tested include the following:

- Correct the over-voltage protection settings for GEN-2006-044
- Correct over-voltage protection settings for ASGI-2011-002

With the mitigation measures applied:

- The transient recovery voltage at the POI remains within a 0.7 to 1.2 pu range following fault clearance;
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations (as per SPP Disturbance Performance Requirements) occur for the synchronous generators in the monitored areas;

2 Introduction

As the Regional Transmission Operator, SPP is responsible to conduct a definitive impact study for its interconnection customers. The customers in DISIS-2016-001 (Group 02) have requested a generation interconnection study through SPP for their respective interconnection requests.

SPP contracted Power Systems Consultants (PSC) to carry out this definitive impact study (DIS), which includes the Group 02 projects listed in Table 2.

The Group 02 projects were analyzed as standalone (other Group 02 projects off line); and together as a cluster (all online).

For the study, both the Group 02 projects and the prior queued projects listed in

Table 3 were monitored, in addition to selected synchronous generators and transmission bus voltages in the following areas:

Area 520 – AEPW: American Electric Power West

Area 524 – OKGE: Oklahoma Gas and Electric

Area 525 – WFEC: Western Farmers Electric Cooperative

Area 526 – SPS: Southwestern Public Service Company

Area 531 – MIDW: Midwest Energy, Inc.

Area 534 – SUNC: Sunflower Electric Power Corporation

Area 536 – WERE: Westar Energy

3 Base case model and generator data

3.1 Simulation Tools

The modelling and studies in this report were performed using the PSS/E Version 32.2.4 software package.

3.2 Power flow data

The power flow data for the Group 02 requested generators GEN-2015-082, GEN-2016-001, GEN-2016-038, GEN-2016-041, GEN-2016-059 and GEN-2016-070 are provided in Table 4 and Table 5. The power flow data were extracted from the base cases and model idevs provide by SPP.

3.3 Power flow base cases

The following base cases were provided by SPP to perform the impact studies:

MDWG15-16WP_DIS1601_G02– 2016 winter peak base case

MDWG15-17SP_DIS1601_G02– 2017 summer peak base case

MDWG15-25SP_DIS1601_G02– 2025 summer peak base case

However, during the course of conducting N-1 power flow studies, a number of contingencies resulted in "blown-up" condition or voltage collapse in the 2016WP and 2017SP cluster scenarios. These contingencies are shown in Table 6.

Table 6: Contingencies Resulting in Voltage Collapse in Cluster Cases

Contingency code	Contingency Description
2016WP_FLT12_3PH_C	Woodward 345kV (515375) to G11-051 Tap 345kV (562075) CKT 1
2016WP_FLT20_3PH_C	Tuco 345kV (525832) to G14-074-Tap 345kV (560027) CKT 1
2016WP_FLT21_3PH_C	G14-074-Tap 345kV (560027) to Oklaunion 345kV (511456) CKT 1
2016WP_FLT48_3PH_C	G11-051 TAP 345kV (562075) to Tatonga 345kV (515407) CKT 1
2016WP_FLT50_3PH_C	Mathewson/Spring Creek 345kV (515497) to Tatonga 345kV (515407) CKT 1
2016WP_FLT57_3PH_C	Hitchland 345kV (523097) to Finney 345kV (523853) CKT 1
2016WP_FLT64_3PH_C	Finney 345kV (523853) to Holcomb 345kV (531449) CKT 1
2017SP_FLT56_3PH_C	Hitchland 345kV (523097) to Walk Tap 345kV (531512) CKT 1

The following network upgrades were added to the original 2016 winter peak, 2017 summer peak and 2025 summer peak base cases on SPP's recommendation to mitigate voltage collapse issues observed due the contingencies listed in Table 6:

- Potter County to Grapevine to Chisholm 345kV circuit 1
- Grapevine to Beaver County 345kV circuit 1
- Beaver County to Clark County 345kV circuit 1
- Accelerate Woodward to Mathewson 345kV circuit 2 (added to 2016 WP and 2017 SP only)

These upgrades were added to the cluster and standalone base cases prior to performing the studies.

The base cases contain the GEN-2015-082, GEN-2016-001, GEN-2016-038, GEN-2016-041, GEN-2016-059 and GEN-2016-070 projects dispatched at 100% output power as well as the prior queued projects listed in Table 3, also dispatched at 100% output power.

Power flow and voltages under system normal conditions for all six projects in the Cluster scenarios are shown in single-line diagrams in Figure 1 to Figure 5.

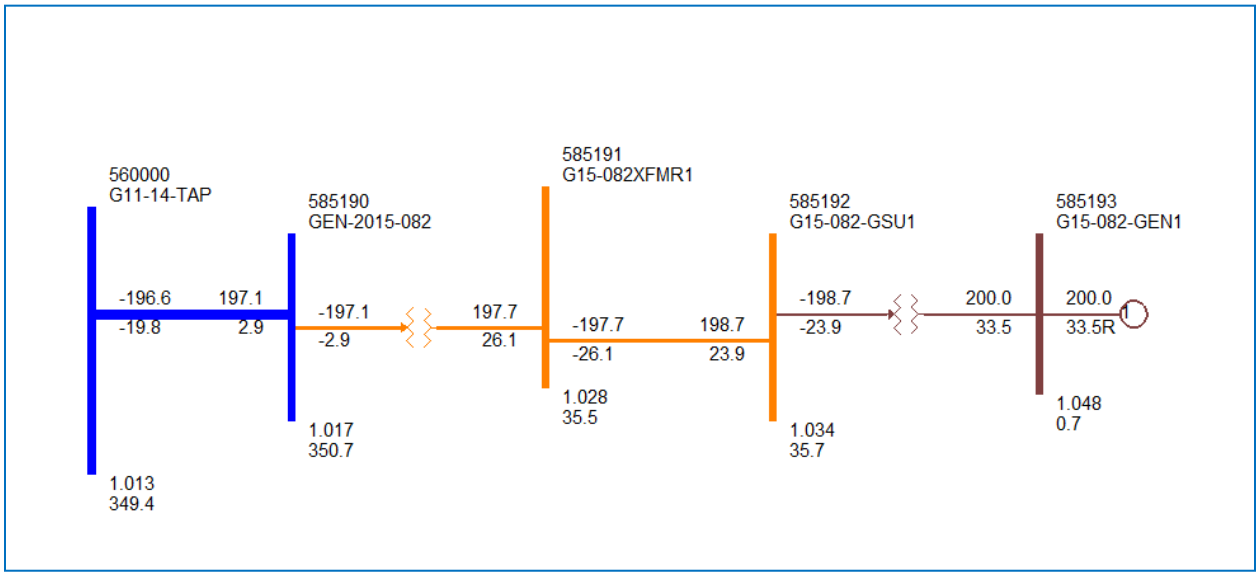

Figure 1: Cluster scenario case- Power flow 2016 Winter Peak GEN-2015-082

3.4 Contingency definitions

The contingencies that were simulated in the stability and power factor analysis are provided in Appendix K.

4 Short circuit analysis

Short circuit analysis was performed using the 2016 winter peak, 2017 summer peak and the 2025 summer peak base cases (cluster scenarios).

Table 7, Table 8 and Table 9 below shows the ten highest short circuit levels based on the post-project short circuit analysis results at buses rated at 115 kV and above. These buses are within five buses away from the POIs listed in Table 2.

The single phase fault short circuit currents were not calculated as no zero sequence line data are included in the base case provided. Appendix J details the short circuit results for all the buses in the Group 02 cluster scenarios that are within five buses away from the POIs and rated at 115 kV and above.

Table 7: Summary of highest Short circuit results per voltage level for 2016 WP Group 02

5 Stability analysis

Stability analysis was conducted for Group 02 Requested Generation for 2016 winter, 2017 summer and 2025 summer peak dynamic cases. Stability analysis was conducted with prior queue projects in service.

The following scenarios were studied:

1. Cluster scenario: all interconnection requests in Group 02 were studied at 100% nameplate output.
2. Standalone scenario: GEN-2015-082 at 100% nameplate output with the other interconnection requests in Group 02 switched off.
3. Standalone scenario: GEN-2016-001at 100% nameplate output with the other interconnection requests in Group 02 switched off
4. Standalone scenario: GEN-2016-038 at 100% nameplate output with the other interconnection requests in Group 02 switched off
5. Standalone scenario: GEN-2016-041 at 100% nameplate output with the other interconnection requests in Group 02 switched off
6. Standalone scenario: GEN-2016-059 at 100% nameplate output with the other interconnection requests in Group 02 switched off
7. Standalone scenario: GEN-2016-070 at 100% nameplate output with the other interconnection requests in Group 02 switched off

Simulations were conducted using contingencies as listed in the Fault Definition Contingency List, see Appendix K for details. Single-phase faults were simulated by applying fault impedance to the positive sequence network at the fault location. As per the SPP current practice to compute the fault levels, the fault impedance was computed to give a positive sequence voltage at the specified fault location of approximately 60% pre-fault voltage.

Each contingency simulation was performed with an initial 1.0 second steady-state run, and a total simulation time of 20 seconds to confirm adequate machine damping.

5.1 Evaluation criteria

The SPP Disturbance Performance Requirements was used to evaluate the stability of interconnection GEN-2015-082, GEN-2016-001, GEN-2016-038, GEN-2016-041, GEN-2016-059 and GEN-2016-070.

In this assessment, a system is considered as stable if the following are observed:

Group 02 requested generators (as listed in Table 2

- Table 2) are able to ride through the contingency fault and recover to pre-fault output and terminal voltage;
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations occur in synchronous machines and oscillatory damping meets the requirements described in Appendix A;

- The transient recovery voltage at the POIs following fault clearance remains within 0.7 to 1.2 pu, as per the requirements described in Appendix A.

5.2 SVC Modelling and Sizing for Instability Mitigation

In order to determine the appropriate SVC that was required to mitigate the under-voltage tripping of generators in the study, a continuous shunt device was modelled at the respective 34.5 kV buses in power flow and set to regulate the voltage at the corresponding 34.5 kV buses; and the standard PSS/e SVC model, CSSCST, was added to the snapshot file corresponding to each continuous shunt device in the power flow with appropriately tuned parameters. The maximum and minimum MVAr of the SVCs were iteratively adjusted until the generators that tripped pre-SVC addition, remain stable and no longer trip after all simulated faults are applied and removed in the dynamic run. The per unit admittance (B) of the SVC was monitored during the dynamic runs to observe the maximum and minimum admittances, which correspond to the maximum and minimum MVAr limits, respectively, of the SVC in per unit on the system MVA base.

5.3 Cluster Dynamic Analysis

The results of the cluster scenario dynamic analysis are summarized in Table 10. For the specified contingency name and corresponding scenario "NO" indicates that the system is unstable and does not meet the evaluation criteria; "NMR" indicates that the system is unstable but no mitigation is required as the contingency is a double-circuit outage; "OK" indicates the system is stable and meets the evaluation criteria and "N/A" indicates that the specified contingency is not applicable.

The following color coding should be used to interpret the post-contingency impacts of single phase (1PH) faults with similarly defined sequence for all three phase (3PH) faults listed in Appendix K.

Instability in 3PH contingency only; mitigation required.	NO
Instability in 1PH contingency only; mitigation required.	NO**
Instability in both 1PH & 3PH contingencies; mitigation required.	NO*
Double-circuit contingency; generator curtailment may be required in real-time.	NMR

5.3.1 Dynamic Analysis Summary

As shown in Table 10, most of the post contingency system instabilities were observed in the 2016WP and 2017SP scenarios.

The main cause of post contingency system instability in the cluster scenarios is due to the over-voltage tripping of the prior queued projects GEN-2006-044 and ASGI-2011-002, and the over-frequency tripping of the GEN-2016-041 project. Only five of the contingencies from the 2017SP cluster scenario resulted in under-voltage tripping of the requested projects; GEN-2016-059 and GEN-2026-038.

5.3.2 Mitigation Measures

Static Var Compensators (SVCs) were used to mitigate the post contingency under-voltage tripping that impacted G16-038-GEN1, G16-038-GEN2, G16-059-GEN1 and G16-059-GEN2. Table 11 shows the SVC requirements that when modeled at the 34.5 kV collector bus of GEN-2016-038 and GEN-2016-059 projects allow both projects to ride through all simulated contingencies listed in Table 10 for all the cluster scenarios.

Table 11: Reactive Power Mitigation measure for Cluster scenario

CLUSTER GROUP 02			
Contingency Name	Base case	Mitigations required	
		Units Requiring SVC	Mitigation Requirements
FLT69	2017 SP	G16-038-GEN1	40/10 MVAR (Capacitive/Inductive)
		G16-038-GEN2	40/10 MVAR (Capacitive/Inductive)
		G16-059-GEN1	60/15 MVAR (Capacitive/Inductive)
		G16-059-GEN2	60/15 MVAR (Capacitive/Inductive)
FLT70		G16-038-GEN1	40/10 MVAR (Capacitive/Inductive)
		G16-038-GEN2	40/10 MVAR (Capacitive/Inductive)
		G16-059-GEN1	60/15 MVAR (Capacitive/Inductive)
		G16-059-GEN2	60/15 MVAR (Capacitive/Inductive)
FLT71		G16-038-GEN1	40/10 MVAR (Capacitive/Inductive)
		G16-038-GEN2	40/10 MVAR (Capacitive/Inductive)
		G16-059-GEN1	60/15 MVAR (Capacitive/Inductive)
		G16-059-GEN2	60/15 MVAR (Capacitive/Inductive)
FLT83		G16-038-GEN1	40/10 MVAR (Capacitive/Inductive)
		G16-038-GEN2	40/10 MVAR (Capacitive/Inductive)
FLT86		G16-059-GEN1	60/15 MVAR (Capacitive/Inductive)
		G16-059-GEN2	60/15 MVAR (Capacitive/Inductive)

The over-voltage protection settings for GEN-2006-044 and ASGI-2011-002 were found to be set incorrectly and were modified to allow both prior queued projects to ride through all simulated contingencies listed in Table 10. The corrected settings are shown in Appendix B.

Extended frequency protection was used to mitigate post contingency over-frequency violations that impacted GEN-2016-041 for several contingencies. The over-frequency threshold and time delay trip settings of GEN-2016-041 were extended to 62.5 hertz and 2.0 seconds, respectively. This change in over-frequency settings allowed GEN-2016-041 to ride through all simulated contingencies listed in Table 10 for all the cluster scenarios. The PV inverter vendor should be consulted to determine valid frequency protection settings for GEN-2016-041.

Additionally, the projects were found to comply with the low voltage ride through requirements in FERC Order 661A.

Selected pre and post mitigation dynamic simulation plots are included in Appendix C for the cluster scenario.

5.4 Standalone Dynamic Analysis

For the specified contingency name and corresponding scenario "NO" indicates that the system is unstable and does not meet the evaluation criteria; "NMR" indicates that the system is unstable but no mitigation is required as the contingency is a double branch outage; "OK" indicates the system is stable and meets the evaluation criteria and "N/A" indicates that the specified contingency is not applicable.

The following color coding should be used to interpret the post-contingency impacts of single phase (1PH) faults with similarly defined sequence for all three phase (3PH) faults listed in Appendix K.

Instability in 3PH contingency only; mitigation required.	NO
Instability in 1PH contingency only; mitigation required.	NO**
Instability in both 1PH & 3PH contingencies; mitigation required.	NO*
Double-circuit contingency; generator curtailment may be required in real-time.	NMR

5.4.1 Standalone scenario (GEN-2015-082)

The dynamic analysis results of the standalone scenario for GEN-2015-082 are summarized in Table 12. The primary reason for the system instability is due to the post contingency overvoltage that results in the trip of the prior queued generators GEN-2006-044 and ASGI-2011-002.

5.4.1.1 Mitigation Measures

The over-voltage protection settings for GEN-2006-044 and ASGI-2011-002 were corrected to allow both prior queued projects to ride through all simulated contingencies listed in Table 12. The modified settings are shown in Appendix B.

Table 13 shows the contingencies that resulted in system instability and impacted the prior queued projects GEN-2006-044 and ASGI-2011-002.

Selected pre and post mitigation dynamic simulation plots are included in Appendix D for standalone scenario (GEN-2015-082).

Table 13: Mitigation measures required for Standalone scenario (GEN-2015-082)

5.4.2 Standalone scenario (GEN-2016-001)

The dynamic analysis results of the standalone scenario for GEN-2016-001 are summarized in Table 14. The primary reason for the system instability is due to the post contingency overvoltage that results in the trip of the prior queued generator GEN-2006-044.

5.4.2.1 Mitigation Measures

The over-voltage protection settings for GEN-2006-044 were corrected to allow this prior queued project to ride through all simulated contingencies listed in Table 14. The modified settings are shown in Appendix B.

Table 15 shows the contingencies that resulted in system instability and impacted the prior queued project GEN-2006-044.

Selected pre and post mitigation dynamic simulation plots are included in Appendix E for standalone scenario (GEN-2016-001).

Table 15: Mitigation measures required for Standalone scenario (GEN-2016-001)

Contingency Name	Base case	Mitigations required

5.4.3 Standalone scenario (GEN-2016-038)

The dynamic analysis results of the standalone scenario for GEN-2015-038 are summarized in Table 16. The primary reason for the system instability is due to the post contingency overvoltage

that results in the trip of the prior queued generators GEN-2006-044 and ASGI-2011-002, and post contingency under-voltage tripping of GEN-2016-038.

Table 16: Summary of stability results for standalone scenario (GEN-2016-038)

5.4.3.1 Mitigation Measures

The over-voltage protection settings for GEN-2006-044 and ASGI-2011-002 were corrected to allow both prior queued projects to ride through all simulated contingencies listed in Table 16. The modified settings for GEN-2006-044 and ASGI-2011-002 are shown in Appendix B.

Static Var Compensators (SVCs) were used to mitigate the post contingency under-voltage tripping of project GEN-2016-038. Table 17 shows the SVC requirements that when modeled at the 34.5 kV collector buses of GEN-2016-038 allow its generators to ride through all simulated contingencies listed in Table 16.

Table 17 shows the contingencies that resulted in system instability and impacted the prior queued projects GEN-2006-044 and ASGI-2011-002, and project GEN-2016-038.

Selected pre and post mitigation dynamic simulation plots are included in Appendix F for standalone scenario (GEN-2016-038).

5.4.4 Standalone scenario (GEN-2016-041)

The dynamic analysis results of the standalone scenario for GEN-2015-041 are summarized in Table 18. The primary reason for the system instability is due to the post contingency overvoltage that results in the trip of the prior queued generators GEN-2006-044 and ASGI-2011-002, and post contingency over-frequency that trips GEN-2016-041.

5.4.4.1 Mitigation Measures

The over-voltage protection settings for GEN-2006-044 and ASGI-2011-002 were corrected to allow both prior queued projects to ride through all simulated contingencies listed in Table 18. The modified settings for GEN-2006-044 and ASGI-2011-002 are shown in Appendix B.

Extended frequency protection was used to mitigate post contingency over-frequency violations that impacted GEN-2016-041 for several contingencies. The over-frequency threshold and time delay trip settings of GEN-2016-041 were extended to 62.5 hertz and 2.0 seconds, respectively. This change in over-frequency settings allowed GEN-2016-041 to ride through all simulated contingencies listed in Table 18. The PV inverter vendor should be consulted to determine valid frequency protection settings.

Table 19 shows the contingencies that resulted in system instability and impacted the prior queued projects GEN-2006-044 and ASGI-2011-002, and project GEN-2016-041.

Selected pre and post mitigation dynamic simulation plots are included in Appendix G for standalone scenario (GEN-2016-041).

Table 19: Mitigation measures required for Standalone scenario (GEN-2016-041)

Contingency Name	Base case	Mitigations required

5.4.5 Standalone scenario (GEN-2016-059)

The dynamic analysis results of the standalone scenario for GEN-2015-059 are summarized in Table 20. The primary reason for the system instability is due to the post contingency overvoltage that results in the trip of the prior queued generators GEN-2006-044 and ASGI-2011-002, and post contingency under-voltage tripping of GEN-2016-059.

5.4.5.1 Mitigation Measures

The over-voltage protection settings for GEN-2006-044 and ASGI-2011-002 were corrected to allow both prior queued projects to ride through all simulated contingencies listed in Table 16. The modified settings for GEN-2006-044 and ASGI-2011-002 are shown in Appendix B.

Static Var Compensators (SVCs) were used to mitigate the post contingency under-voltage tripping of project GEN-2016-059. Table 21 shows the SVC requirements that when modeled at the 34.5 kV bus of GEN-2016-059 allow its generators to ride through all simulated contingencies listed in Table 20.

Table 21 shows the contingencies that resulted in system instability and impacted the prior queued projects GEN-2006-044 and ASGI-2011-002, and project GEN-2016-059.

Selected pre and post mitigation dynamic simulation plots are included in Appendix H for standalone scenario (GEN-2016-059).

5.4.6 Standalone scenario (GEN-2016-070)

The dynamic analysis results of the standalone scenario for GEN-2016-070 are summarized in Table 22. The primary reason for the system instability is due to the post contingency overvoltage that results in the trip of the prior queued generators GEN-2006-044 and ASGI-2011-002.

Table 22: Summary of stability results for standalone scenario (GEN-2016-070)

5.4.6.1 Mitigation Measures

The over-voltage protection settings for GEN-2006-044 and ASGI-2011-002 were corrected to allow both prior queued projects to ride through all simulated contingencies listed in Table 22. The modified settings are shown in Appendix B.

Table 23 shows the contingencies that resulted in system instability and impacted the prior queued projects GEN-2006-044 and ASGI-2011-002.

Selected pre and post mitigation dynamic simulation plots are included in Appendix I for standalone scenario (GEN-2016-070).

6 Power factor analysis

Power factor analysis is to determine the reactive compensation needed to hold the scheduled voltage at the POI. The analysis was performed on the Cluster Scenario only.

The projects were turned off during the power factor analysis and replaced by a generator with no VAr capability on the HV bus of the projects. Each generator was dispatched at 100% output of the project. A VAr generator was modeled at the same HV bus and set to hold a voltage schedule at the POI consistent with the voltage schedule in the provided base case or 1.0 pu voltage (whichever is higher). The reactive power of the VAr generator is determined from the power flow calculations. All three phase N-1 faults listed in Appendix K were applied, and the power factor monitored.

The power factor analysis results for the listed faults are shown in Table 24, Table 25, Table 27, Table 28, Table 30 and Table 31. The results presented show that reactive power is needed to support the voltage at the studied area.

Further analysis was performed on the Cluster Scenario using the low wind/no wind conditions. The analysis consisted of the following:

- The generator and capacitor bank (if installed) were switched out of service with the collector system as modeled remaining in service.

- The resulting reactive power injection into the transmission network comes from the capacitance of the project's transmission lines and collector cables. This reactive power injection is measured at the POI. Shunt reactors were added at the study project substation high side bus to bring the MVAr flow into the POI down to approximately zero.

The results of this analysis are summarized in Table 26, Table 29, and Table 32.

Table 32: Reactive power from the project's transmission lines for 2025 SP Base Case

Request	Reactive Power Injection at POI (MVAr)	Shunt Reactors required at High Voltage Buses (MVAr)
GEN-2015-082	25.7	25.7
GEN-2016-001	14.7	14.7
GEN-2016-038	56.1	56.1
GEN-2016-059	56.7	56.7
GEN-2016-041	20.1	20.1
GEN-2016-070	3.4	3.4

7 Conclusions

The definitive impact studies include short circuit analysis, stability analysis, reactive analysis and power factor analysis.

The following base cases were provided by SPP to perform the impact studies:

MDWG15-16WP_DIS1601_G02– 2016 winter peak base case

MDWG15-17SP_DIS1601_G02– 2017 summer peak base case

MDWG15-25SP_DIS1601_G02– 2025 summer peak base case

However, the following network upgrades were added to the original base cases on SPP's recommendation to mitigate voltage collapse issues for certain N-1 contingencies observed in the cluster base cases:

- Potter County to Grapevine to Chisholm 345kV circuit 1
- Grapevine to Beaver County 345kV circuit 1
- Beaver County to Clark County 345kV circuit 1
- Accelerate Woodward to Mathewson 345kV circuit 2 (added to 2016 WP and 2017 SP only)

These upgrades were added to the cluster and standalone base cases prior to performing the studies.

7.1 Cluster power factor analysis

A power factor analysis for each generation project was performed on the 2016 winter peak, 2017 summer peak, and 2025 summer peak cases with identified system upgrades. As reactive power is required for all projects, the final requirement per the SPP Open Access Transmission Tariff (OATT) will be the pro-forma 95% lagging to 95% leading at the point of interconnection.

A low wind/no wind (low irradiance/no irradiance) analysis was performed on both wind powered and solar powered generation projects. This analysis determines the amount reactors needed to offset the capacitive injection as a result of the charging in the transmission lead from the project to the Point of Interconnection (POI) and the charging in the collector system while the project is on line but producing little or no power.

7.2 Cluster Short-circuit analysis

Short-circuit current levels were calculated for all transmission buses (rated at 115 kV and above) within five buses away from the POI of all the cluster generators. The total short circuit currents at the mentioned buses are within the typical range of the breaker duty requirements and the short circuit current contribution from requested project is not anticipated to impact breaker duty requirements.

7.3 Cluster dynamic scenario

One hundred and ninety-one contingencies were simulated for the 2016 winter peak and 2017 summer peak base cases, and one hundred and ninety-two contingencies were simulated for the 2025 summer peak base case. The contingencies simulated include single phase, three phase and single phase stuck breaker faults and three phase faults with a prior outage branch.

A number of contingencies resulted in system instability, which led to the loss of prior queue and requested generation. Mitigation measures were required to enable system stability following these contingencies. The prior queue and requested projects that were impacted by post contingency system instability are as follows:

Project GEN-2016-041: Over-frequency tripping

Project GEN-2016-038: Under-voltage tripping (In 2017SP scenario only)

Project GEN-2016-059: Under-voltage tripping (In 2017SP scenario only)

Prior project GEN-2006-044: Over-voltage tripping

Prior project ASGI-2011-002: Over-voltage tripping

Mitigation measures that were tested include the following:

- Correct the over-voltage protection thresholds and time delay settings for GEN-2006-044 and ASGI-2011-002
- Modify the over-frequency protection threshold and time delay settings for GEN-2016-041
- Add dynamic reactive power support on the 34.5 kV collector buses of GEN-2016-038 and GEN-2016-059

With the mitigation measures applied:

- Group 02 generators (as listed in Table 2) are able to ride through all the simulated contingencies and the transient recovery voltage at the Points of Interconnection (POIs) remains within 0.7 to 1.2 per unit (pu) following fault clearance (as per SPP Disturbance Performance Requirements);
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations (as per SPP Disturbance Performance Requirements) occur for the synchronous generators in the monitored areas;
- The projects were found to comply with the low voltage ride through requirements in FERC Order 661A.

7.4 Standalone dynamic scenario, GEN-2015-082

Seventy-three contingencies were simulated for each of the three base cases: 2016 winter peak, 2017 summer peak, and 2025 summer peak.

A number of contingencies resulted in system instability, which led to the loss of prior queue generation. Mitigation measures were required to enable system stability following these contingencies. The prior queue projects that were impacted by post contingency system instability are as follows:

- Prior project GEN-2006-044: Over-voltage tripping
- Prior project ASGI-2011-002: Over-voltage tripping

Mitigation measures that were tested include the following:

- Correct the over-voltage protection settings for GEN-2006-044
- Correct the over-voltage protection for ASGI-2011-002

With the mitigation measures applied:

- The transient recovery voltage at the Point of Interconnection (POI) remains within 0.7 to 1.2 per unit (pu) following fault clearance (as per SPP Disturbance Performance Requirements);
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations (as per SPP Disturbance Performance Requirements) occur for the synchronous generators in the monitored areas;

7.5 Standalone dynamic scenario, GEN-2016-001

Seventy-four contingencies were simulated for each of the three base cases: 2016 winter peak, 2017 summer peak, and 2025 summer peak.

A number of contingencies resulted in system instability, which led to the loss of prior queue generation. Mitigation measures were required to enable system stability following these contingencies. The prior queue projects that were impacted by post contingency system instability are as follows:

- Prior project GEN-2006-044: Over-voltage tripping
- Prior project ASGI-2011-002: Over-voltage tripping

Mitigation measures that were tested included one or more of the following:

- Correct the over-voltage protection settings for GEN-2006-044

- Correct the over-voltage protection for ASGI-2011-002

With the mitigation measures applied:

- The transient recovery voltage at the Point of Interconnection (POI) remains within 0.7 to 1.2 per unit (pu) following fault clearance (as per SPP Disturbance Performance Requirements);
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations (as per SPP Disturbance Performance Requirements) occur for the synchronous generators in the monitored areas;

7.6 Standalone dynamic scenario, GEN-2016-038

Twenty-one contingencies were simulated for each of the three base cases: 2016 winter peak, 2017 summer peak, and 2025 summer peak.

A number of contingencies resulted in system instability, which led to the loss of GEN-2016-038 and prior queue generation. Mitigation measures were required to enable system stability following these contingencies. The requested and prior queue projects that were impacted by post contingency system instability are as follows:

- Prior project GEN-2006-044: Over-voltage tripping
- Prior project ASGI-2011-002: Over-voltage tripping
- Project GEN-2016-038: Under-voltage tripping

Mitigation measures that were tested include the following:

- Modify over-voltage protection settings for GEN-2006-044 and ASGI-2011-002
- Add dynamic reactive power support on the 34.5 kV collector buses of GEN-2016-038

With the mitigation measures applied:

- GEN-2016-038 is able to ride through all the simulated contingencies and the transient recovery voltage at the POI remains within a 0.7 to 1.2 pu range following fault clearance;
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations (as per SPP Disturbance Performance Requirements) occur for the synchronous generators in the monitored areas;

7.7 Standalone dynamic scenario, GEN-2016-041

Forty-five contingencies were simulated for each of the three base cases: 2016 winter peak, 2017 summer peak, and 2025 summer peak.

A number of contingencies resulted in system instability, which led to the loss of GEN-2016-041 and prior queue generation. Mitigation measures were required to enable system stability following these contingencies. The requested and prior queue projects that were impacted by post contingency system instability are as follows:

- Prior project GEN-2006-044: Over-voltage tripping
- Prior project ASGI-2011-002: Over-voltage tripping
- Project GEN-2016-041: Over-frequency tripping

Mitigation measures that were tested include the following:

- Correct the over-voltage protection settings for GEN-2006-044 and ASGI-2011-002
- Modify the over-frequency protection threshold and time delay settings for GEN-2016-041

With the mitigation measures applied:

- GEN-2016-041 is able to ride through all the simulated contingencies and the transient recovery voltage at the POI remains within a 0.7 to 1.2 pu range following fault clearance;
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations (as per SPP Disturbance Performance Requirements) occur for the synchronous generators in the monitored areas;

7.8 Standalone dynamic scenario, GEN-2016-059

Twenty-one contingencies were simulated for each of the three base cases: 2016 winter peak, 2017 summer peak, and 2025 summer peak.

A number of contingencies resulted in system instability, which led to the loss of GEN-2016-059 and prior queue generation. Mitigation measures were required to enable system stability following these contingencies. The requested and prior queue projects that were impacted by post contingency system instability are as follows:

- Prior project GEN-2006-044: Over-voltage tripping
- Prior project ASGI-2011-002: Over-voltage tripping
- Project GEN-2016-059: Under-voltage tripping

Mitigation measures that were tested include the following:

- Correct the over-voltage protection settings for GEN-2006-044 and ASGI-2011-002
- Add dynamic reactive power support at the 34.5 kV collector buses of GEN-2016-059

With the mitigation measures applied:

- GEN-2016-059 is able to ride through all the simulated contingencies and the transient recovery voltage at the POI remains within a 0.7 to 1.2 pu range following fault clearance;
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations (as per SPP Disturbance Performance Requirements) occur for the synchronous generators in the monitored areas;

7.9 Standalone dynamic scenario, GEN-2016-070

Seventeen contingencies were simulated for each of the three base cases: 2016 winter peak, 2017 summer peak, and 2025 summer peak.

A number of contingencies resulted in system instability, which led to the loss of prior queue generation. Mitigation measures were required to enable system stability following these contingencies. The prior queue projects that were impacted by post contingency system instability are as follows:

- Prior project GEN-2006-044: Over-voltage tripping
- Prior project ASGI-2011-002: Over-voltage tripping

Mitigation measures that were tested include the following:

- Correct the over-voltage protection settings for GEN-2006-044
- Correct over-voltage protection settings for ASGI-2011-002

With the mitigation measures applied:

- The transient recovery voltage at the POI remains within a 0.7 to 1.2 pu range following fault clearance;
- No tripping of prior queue projects occurs;
- No large rotor angle deviation and oscillations (as per SPP Disturbance Performance Requirements) occur for the synchronous generators in the monitored areas;

Appendix A Southwest Power Pool Disturbance Performance Requirements

Southwest Power Pool
Disturbance Performance Requirements

OVERVIEW

These Disturbance Performance Requirements ("Requirements") shall be applicable to the Bulk Electric System within the Southwest Power Pool Planning Area. Utilization of these Requirements applies to all registered entities within the Southwest Power Pool Planning Area. These Requirements shall not be applicable to facilities that are not part of Bulk Electric System. More stringent Requirements are at the sole discretion of each Transmission Owner.

Transient and dynamic stability assessments are generally performed to assure adequate avoidance of loss of generator synchronism and prevention of system voltage collapse within the first 20 seconds after a system disturbance. These Requirements provide a basis for evaluating the system response during the initial transient period following a disturbance on the Bulk Electric System by establishing minimum requirements for machine rotor angle damping and transient voltage recovery.

ROTOR ANGLE DAMPING REQUIREMENT

Machine Rotor Angles shall exhibit well damped angular oscillations [as defined below] and acceptable power swings following a disturbance on the Bulk Electric System for all NERC Category A, B and C events.

Well damped angular oscillations shall meet one of the following two requirements when calculated directly from the rotor angle:

1. Successive Positive Peak Ratio (SPPR) must be less than or equal to 0.95 where SPPR is calculated as follows:

$$SPPR = \frac{\text{Peak Rotor Angle of } 2^{nd} \text{ Positive Swing Peak}}{\text{Peak Rotor Angle of } 1^{st} \text{ Positive Swing Peak}} \leq 0.95$$

-or- Damping Factor % = (1 – SPPR) OK 100% $\geq$ 5%

The machine rotor angle damping ratio may be determined by appropriate modal analysis (i.e. Prony Analysis) where the following equivalent requirement must be met:

Damping Ratio ≥ 0.0081633

2. Successive Positive Peak Ratio Five (SPPR5) must be less than or equal to 0.774 where SPPR5 is calculated as follows:

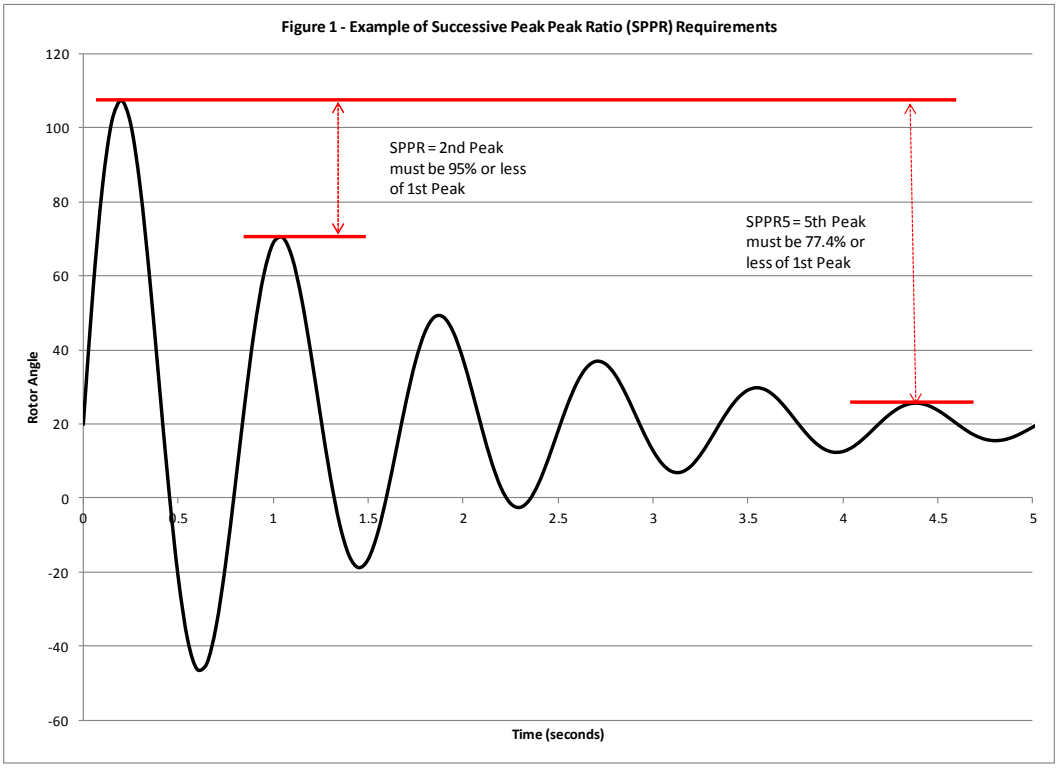
$$SPPR5 = \frac{\text{Peak Rotor Angle of 5}^{th}\text{ Positive Swing Peak}}{\text{Peak Rotor Angle of 1}^{st}\text{ Positive Swing Peak}} \leq 0.774$$

-or- Damping Factor % = (1 – SPPR) OK 100% ≥ 22.6%

The machine rotor angle damping ratio may be determined by appropriate modal analysis (i.e. Prony Analysis) where the following equivalent requirement must be met:

Damping Ratio ≥ 0.0081633

Qualitatively, these Requirements are shown in the figure below.



TRANSIENT VOLTAGE RECOVERY REQUIREMENT

Any time after a disturbance is cleared; bus voltages on the Bulk Electric System shall not swing outside of the bandwidth of 0.70 per unit to 1.20 per unit.

Qualitatively, this Requirement is shown in the figure below.

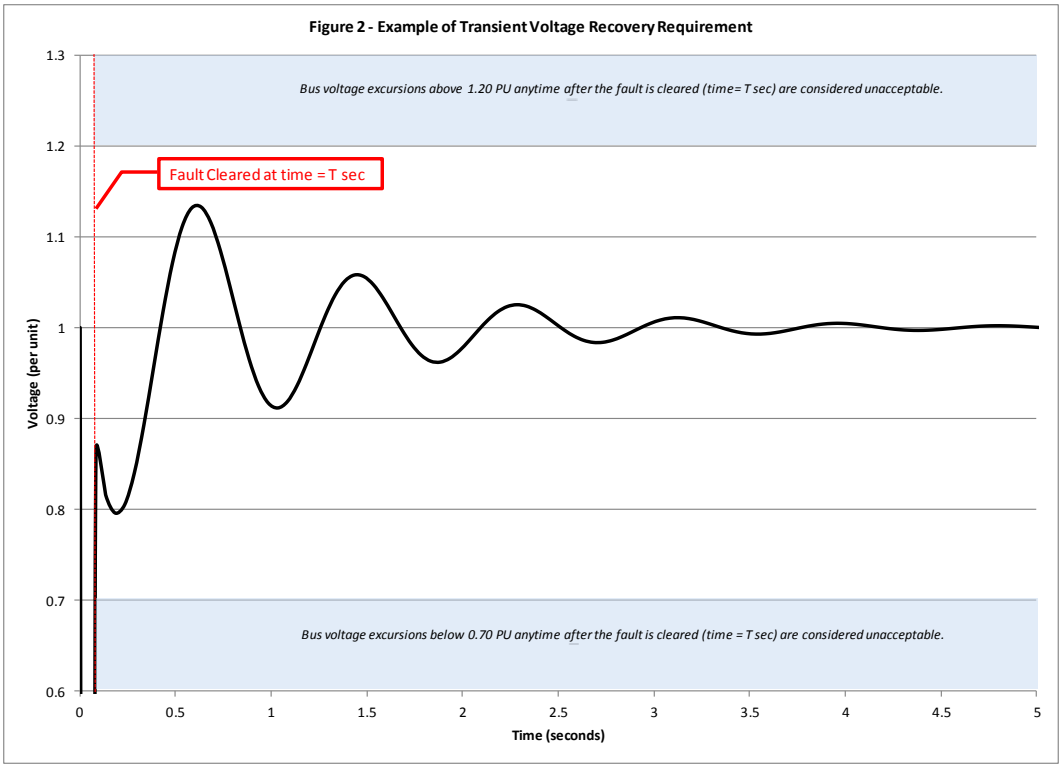


Figure 2 - Example of Transient Voltage Recovery Requirement
Bus voltage excursions above 1.20 PU anytime after the fault is cleared (time= T sec) are considered unacceptable.
Fault Cleared at time = T sec
Bus voltage excursions below 0.70 PU anytime after the fault is cleared (time = T sec) are considered unacceptable.

Appendix K Fault Definition Contingency List for DISIS-2016-001 Group 02 Cases

Cont. Name	Description	GEN-2015-082	GEN-2016-001	GEN-2016-038	GEN-2016-041	GEN-2016-059	GEN-2016-070
FLT01-3PH	3 phase fault on the G11-014-Tap 345kV (560000) to G16-001 – TAP 345kV (560070) (to Woodward (515375)) CKT 1, near G11-014-Tap. a. Apply fault at the G11-014-Tap 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X		X		
FLT02-3PH	3 phase fault on the G16-001-Tap 345kV (560070) to G11-014 – TAP 345kV (560000) CKT 1, near G16-001-Tap. a. Apply fault at the G16-001-Tap 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X		X		
FLT03-3PH	3 phase fault on the G11-014-Tap 345kV (560000) to G16-001 – TAP 345kV (560070) CKT 1 & 2, near G11-014-Tap. a. Apply fault at the G11-014-Tap 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X		X		
FLT04-3PH	3 phase fault on the G16-001-Tap 345kV (560070) to G11-014-Tap 345kV (560000) CKT 1 & 2, near G16-001-Tap. a. Apply fault at the G16-001-Tap 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X		X		
FLT05-3PH	3 phase fault on the G11-014-Tap 345kV (560000) to Beaver County 345kV (515554) CKT 1, near G11-014-Tap. a. Apply fault at the G11-014-Tap 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X		X		
FLT06-3PH	3 phase fault on the G11-014-Tap 345kV (560000) to Beaver County 345kV (515554) CKT 1 & 2, near G11-014-Tap. a. Apply fault at the G11-014-Tap 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X		X		

Cont. Name	Description	GEN-2015-082	GEN-2016-001	GEN-2016-038	GEN-2016-041	GEN-2016-059	GEN-2016-070
FLT07-3PH	3 phase fault on the G16-001-Tap 345kV (560070) to G16-003 – TAP 345kV (560071) CKT 1, near G16-001-Tap. a. Apply fault at the G16-001-Tap 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X		X		
FLT08-3PH	3 phase fault on the G16-001-Tap 345kV (560070) to G16-003 – TAP 345kV (560071) CKT 1 & 2, near G16-001-Tap. a. Apply fault at the G16-001-Tap 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X		X		
FLT09-3PH	3 phase fault on the G16-003 – TAP 345kV (560071) to Woodward 345kV (515375) CKT 1, near G16-003 – TAP. a. Apply fault at the G16-003 – TAP 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X		X		
FLT10-3PH	3 phase fault on the G16-003 – TAP 345kV (560071) to Woodward 345kV (515375) CKT 1 and 2, near G16-003 – TAP. a. Apply fault at the G16-003 – TAP 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X		X		
FLT11-3PH	3 phase fault on the Woodward 345kV (515375) to Border 345kV (515458) CKT 1, near Woodward. a. Apply fault at the Woodward 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X		X		
FLT12-3PH	3 phase fault on the Woodward 345kV (515375) to G11-051 Tap 345kV (562075) CKT 1, near Woodward. a. Apply fault at the Woodward 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X		X		
FLT13-3PH	3 phase fault on the Woodward 345kV (515375) to G11-051-Tap 345kV (562075) CKT 1 and 2, near Woodward. a. Apply fault at the Woodward 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X		X		

Cont. Name	Description	GEN-2015-082	GEN-2016-001	GEN-2016-038	GEN-2016-041	GEN-2016-059	GEN-2016-070
FLT14-3PH	3 phase fault on the Beaver County 345kV (515554) to Optima 345kV (560010) 345kV CKT 1, near Beaver County. a. Apply fault at the Beaver County 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X		X		
FLT15-3PH	3 phase fault on the Beaver County 345kV (515554) to Optima 345kV (560010) CKT 1 and 2, near Beaver County. a. Apply fault at the Beaver County 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X		X		
FLT16-3PH	3 phase fault on Hitchland 345kV (523097) to Optima 345kV (560010) CKT 1, near Hitchland. a. Apply fault at the Hitchland 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X		X		
FLT17-3PH	3 phase fault on the Hitchland 345kV (523097) to Optima 345kV (560010) CKT 1 and 2, near Hitchland. a. Apply fault at the Hitchland 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X		X		
FLT18-3PH	3 phase fault on the Woodward 345kV (515375) to Woodward 138kV (515376) Woodward 13.8kV (515799) XFMR CKT 2, near Woodward 345kV. a. Apply fault at the Woodward 345kV bus. b. Clear fault after 5 cycles and trip the faulted transformer.	X	X		X		
FLT19-3PH	3 phase fault on the Border 345kV (515458) to Tuco 345kV (525832) CKT 1, near Border. a. Apply fault at the Border 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				
FLT20-3PH	3 phase fault on the Tuco 345kV (525832) to G14-074-Tap 345kV (560027) CKT 1, near Tuco. a. Apply fault at the Tuco 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				

Cont. Name	Description	GEN-2015-082	GEN-2016-001	GEN-2016-038	GEN-2016-041	GEN-2016-059	GEN-2016-070
FLT21-3PH	3 phase fault on the G14-074-Tap 345kV (560027) to Oklaunion 345kV (511456) CKT 1, near G14-074-Tap. a. Apply fault at the G14-074-Tap 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.		X				
FLT22-3PH	3 phase fault on the Thistle 345kV (539801) to Woodward 345kV (515375) CKT 1, near Woodward. a. Apply fault at the Woodward 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				
FLT23-3PH	3 phase fault on the Thistle 345kV (539801) to Woodward 345kV (515375) CKT 1 and 2, near Thistle. a. Apply fault at the Thistle 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X				
FLT24-3PH	3 phase fault on the Thistle 345kV (539801) to G1524&G1525T 345kV (560033) CKT 1, near Thistle. a. Apply fault at the Thistle 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				
FLT25-3PH	3 phase fault on the Thistle 345kV (539801) to G1524&G1525T 345kV (560033) CKT 1 and 2, near Thistle. a. Apply fault at the Thistle 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X				
FLT26-3PH	3 phase fault on the Thistle 345kV (539801) to G16-005 TAP 345kV (560072) CKT 1, near Thistle. a. Apply fault at the Thistle 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				
FLT27-3PH	3 phase fault on the Thistle 345kV (539801) to G16-005 TAP 345kV (560072) CKT 1 and 2, near Thistle. a. Apply fault at the Thistle 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X				

Cont. Name	Description	GEN-2015-082	GEN-2016-001	GEN-2016-038	GEN-2016-041	GEN-2016-059	GEN-2016-070
FLT28-3PH	3 phase fault on the Thistle 345kV (539801) to Thistle 138kV (539804) Thistle 13.8kV (539802) XFMR CKT 1, near Thistle 345kV. a. Apply fault at the Thistle 345kV bus. b. Clear fault after 5 cycles and trip the faulted transformer	X	X				
FLT29-3PH	3 phase fault on the G16-005 TAP 345kV (560072) to Clark County 345kV (539800) CKT 1, near G16-005 TAP. a. Apply fault at the G16-005 TAP 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				
FLT30-3PH	3 phase fault on the G16-005 TAP 345kV (560072) to Clark County 345kV (539800) CKT 1 and 2, near G16-005 TAP. a. Apply fault at the G16-005 TAP 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X				
FLT31-3PH	3 phase fault on the Clark County 345kV (539800) to G16-046 TAP (560080) CKT 1, near Clark County. a. Apply fault at the Clark County 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				
FLT32-3PH	3 phase fault on the Clark County 345kV (539800) to Ironwood 345 kV (560002) CKT 1, near Clark County. a. Apply fault at the Clark County 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				
FLT33-3PH	3 phase fault on the G16-046 TAP 345kV (560080) to Ironwood 345 kV (539803) CKT 1, near G16-046 TAP. a. Apply fault at the G16-046 TAP 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.		X				
FLT34-3PH	3 phase fault on the G1524&G1525T 345 kV (560033) to Wichita 345kV (532796) CKT 1, near G1524&G1525T. a. Apply fault at the G1524&G1525T 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				

Cont. Name	Description	GEN-2015-082	GEN-2016-001	GEN-2016-038	GEN-2016-041	GEN-2016-059	GEN-2016-070
FLT35-3PH	3 phase fault on the G1524&G1525T 345 kV (560033) to Wichita 345kV (532796) CKT 1 and 2, near G1524&G1525T. a. Apply fault at the G1524&G1525T 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X				
FLT36-3PH	3 phase fault on the Wichita 345kV (532796) to Benton 345kV (532791) CKT 1, near Wichita. a. Apply fault at the Wichita 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				
FLT37-3PH	3 phase fault on the Wichita 345kV (532796) to Reno 345kV (532771) CKT 1, near Wichita. a. Apply fault at the Wichita 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				
FLT38-3PH	3 phase fault on the Wichita 345kV (532796) to Viola 345kV (532798) CKT 1, near Wichita. a. Apply fault at the Wichita 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				
FLT39-3PH	3 phase fault on the G14-001 TAP 345kV (562476) to Wichita 345kV (532796) CKT 1, near Wichita. a. Apply fault at the Wichita 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				
FLT40-3PH	3 phase fault on the Wichita 345kV (532796) to Evans 138kV (533040) Wichita 13.8kV (532829) XFMR CKT 1, near Wichita 345kV. a. Apply fault at the Wichita 345kV bus. b. Clear fault after 5 cycles and trip the faulted transformer	X	X				
FLT41-3PH	3 phase fault on the Benton 345kV (532791) to Benton 138kV (532986), Wichita 13.8kV (532821) XFMR CKT 1, near Benton 345kV. a. Apply fault at the Benton 345kV bus. b. Clear fault after 5 cycles and trip the faulted transformer		X				

Cont. Name	Description	GEN-2015-082	GEN-2016-001	GEN-2016-038	GEN-2016-041	GEN-2016-059	GEN-2016-070
FLT42-3PH	3 phase fault on the Reno 345kV (532771) to Reno 138kV (533416), Reno 13.8kV (532807) XFMR CKT 1, near Reno 345kV. a. Apply fault at the Reno 345kV bus. b. Clear fault after 5 cycles and trip the faulted transformer		X				
FLT43-3PH	3 phase fault on the Benton 345kV (532791) to Wolf Creek 345kV (532797) CKT 1, near Benton. a. Apply fault at the Benton 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.		X				
FLT44-3PH	3 phase fault on the Benton 345kV (532791) to Rose Hill 345kV (532794) CKT 1, near Benton. a. Apply fault at the Benton 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.		X				
FLT45-3PH	3 phase fault on the Reno 345kV (532771) to Summit 345kV (532773) CKT 1, near Reno. a. Apply fault at the Reno 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.		X				
FLT46-3PH	3 phase fault on the Viola 345kV (532798) to Renfrow 345kV (515543) CKT 1, near Viola. a. Apply fault at the Viola 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.		X				
FLT47-3PH	3 phase fault on the G14-001 TAP 345kV (562476) to Empec 345kV (532768) CKT 1, near G14-001 TAP. a. Apply fault at the G14-001 TAP 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.		X				

Cont. Name	Description	GEN-2015-082	GEN-2016-001	GEN-2016-038	GEN-2016-041	GEN-2016-059	GEN-2016-070
FLT48-3PH	3 phase fault on the G11-051 TAP 345kV (562075) to Tatonga 345kV (515407) CKT 1, near G11-051 TAP. a. Apply fault at the G11-051 TAP 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				
FLT49-3PH	3 phase fault on the G11-051 TAP 345kV (562075) to Tatonga 345kV (515407) CKT 1 and 2, near G11-051 TAP. a. Apply fault at the G11-051 TAP 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X				
FLT50-3PH	3 phase fault on the Mathewson/Spring Creek 345kV (515497) to Tatonga 345kV (515407) CKT 1, near Tatonga. a. Apply fault at the Tatonga 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				
FLT51-3PH (25SP Only)	3 phase fault on the Mathewson/Spring Creek 345kV (515497) to Tatonga 345kV (515407) CKT 1 and 2, near Tatonga. a. Apply fault at the Tatonga 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X				
FLT52-3PH	3 phase fault on the Mathewson/Spring Creek 345kV (515497) to Cimarron 345kV (514901) CKT 1, near Mathewson/Spring Creek. a. Apply fault at the Mathewson/Spring Creek 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X				
FLT53-3PH	3 phase fault on the Mathewson/Spring Creek 345kV (515497) to Cimarron 345kV (514901) CKT 1 and 2, near Mathewson/Spring Creek. a. Apply fault at the Mathewson/Spring Creek 345kV bus. b. Clear fault after 5 cycles and trip the faulted lines (CKT 1 and 2).	X	X				
FLT54-3PH	3 phase fault on the Mathewson/Spring Creek 345kV (515497) to Northwest 345kV (514880) CKT 1, near Mathewson/Spring Creek. a. Apply fault at the Mathewson/Spring Creek 345kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.	X	X

1. EXECUTIVE SUMMARY

S&C Electric Company (S&C) has performed several analysis as part of a Definitive Interconnection System Impact Study, DISIS-2016-001 (Group 3), in response to a request through Southwest Power Pool (SPP) to administer a subsection of Attachment V to the SPP Open Access Transmission Tariff (Tariff). Group 3 consists of four (4) new wind generator interconnection requests (GEN-2016-005, GEN-2016-016, GEN-2016-046, and GEN-2016-049).

S&C has performed dynamic stability analysis for Group 3 under Cluster and Stand-Alone (SA) scenarios. The cluster studies were performed using three (3) cluster base cases (2016 Winter Peak (WP), 2017 Summer Peak (SP), and 2025 SP) provided by SPP. In the cluster studies, all four new interconnection requests and prior-queued projects were studied at 100% of nameplate MW capacity. The standalone studies were performed using three (3) standalone base cases (2016 WP, 2017 SP, and 2025 SP) provided by SPP and by placing an interconnection request into service, one at a time. The in-service interconnection project was dispatched at 100% power and the three (3) out of service interconnection projects were set to zero generation or to its pre-project value if the project is an increase to an existing project or facility. The dynamic stability study revealed that Group 3 projects met the SPP transient voltage requirements, with the solutions illustrated in the dynamic stability results section of this report.

S&C has performed power factor analysis on Group 3 Cluster scenarios. Power factor analysis reported the power factors at the study projects point of interconnection (POI) for all N-1 three-phase contingences and marked the contingency at which the required power factor at the POI of study projects to maintain the voltages at the desired level is beyond the normal required capability (from 0.95 lagging to 0.95 leading) of the studied projects. The power factor requirement for GEN-2016-005, GEN-2016-016, GEN-2016-046, and GEN-2016-049 interconnection requests is from 0.95 lagging to 0.95 leading power factor at the POIs.

S&C has performed an analysis of low wind/low solar irradiance conditions for interconnection requests that are renewable energy projects. The low wind/low solar irradiance analysis was performed only under the cluster cases by taking the interconnection generation out of service and determining the Mvar size of a shunt reactor to offset the reactive power generated from the

capacitance of the project's transmission lines and collector cables. The shunt reactor Mvars are given in Section 8.

S&C has performed a short-circuit analysis for the 2017 Summer Peak and 2025 Summer Peak under Group 3 Cluster and reported short circuit results at all buses up to five (5) levels away from the POI of the study projects.

2. INTRODUCTION

S&C has performed several analysis as part of a Definitive Interconnection System Impact Study, DISIS-2016-001 (Group 3), in response to a request through the SPP to administer a subsection of Attachment V to the SPP Tariff. Group 3 consist of four (4) new generator interconnection requests listed in Table 1 and nineteen (19) previously queued projects listed in Table 2.

Table 1: Group 3 Generation Interconnection Requests

Project	Size (MW)	Generator Model	Generator Bus(es)	Point of Interconnection (POI)	POI Bus
GEN-2016-005	150	Vestas V110 2.0MW wind	587044	GEN-2016-005-TAP 345 kV (Tap on Clark County – Thistle 345 kV line)	539800-539801 (560072)
GEN-2016-016	78.2	GE 2.3MW wind	587123	North Kinsley 115 kV	530619
GEN-2016-046	299	GE 2.3MW wind	587313	GEN-2016-046-TAP 345 kV (Tap on Clark County – Ironwood 345 kV line)	539800-539803 (560080)
GEN-2016-049	310.2	Vestas V117 GS 3.3MW wind	587343/ 587346	GEN-2016-049-TAP 345 kV (Tap on GEN-2013-010 Tap/Post Rock – Spearville 345 kV line)	530583 /562334-531469 (560081)

Table 2: Prior Queued Projects

Request	Size (MW)	Generator Model	Point of Interconnection
GEN-2001-039A	104.0	GE 1.6MW	Shooting Star 115 kV (539763)
GEN-2002-025A	150.0	GE 1.5 MW	Spearville 230 kV (539695)

GEN-2012-024	180.0	Vestas V112-3.0MW	Clark County 345 kV (539800)
GEN-2013-010	99.0	Siemens 3.0MW (583603)	GEN-2013-010 Tap 345 kV (562334) (Tap on Spearville to Post Rock 345 kV line)
GEN-2015-021	20.0	AE 1000NX 1MW PV Inverter (584633)	Johnson Corner 115 kV (531424)
ASGI-2015-001	4.27 Summer 6.13 Winter	GENSAL (584713)	Ninnescah 115 kV (539648)

3. TRANSMISSION SYSTEM AND STUDY AREA

The interconnection requests in Group 3 will interconnect into Midwest Energy (MIDW, Area #531) and Sunflower Electric Power Corporation (SUNC, Area #534). In addition to Areas #531 and #534, the following area was also monitored: Southwestern Public Service (SPS, Area #526)

4. POWER FLOW BASE CASES

DISIS-2016-001 (Group 3) and prior-queued projects were modeled as aggregated generating units in the base cases from SPP.

Cluster Scenario Base Cases

- **MDWG15-16WP_DIS1601_G03.sav** – 2016 Winter Peak Cluster Base Case for Group 3. DISIS-2016-001 interconnection requests and prior queued projects within Group 3 are at 100% output power.
- **MDWG15-17SP_DIS1601_G03.sav** – 2017 Summer Peak Cluster Base Case for Group 3. DISIS-2016-001 interconnection requests and prior queued projects within Group 3 are at 100% output power.
- **MDWG15-25SP_DIS1601_G03.sav** – 2025 Summer Peak Cluster Base Case for Group 3. DISIS-2016-001 interconnection requests and prior queued projects within Group 3 are at 100% output power.

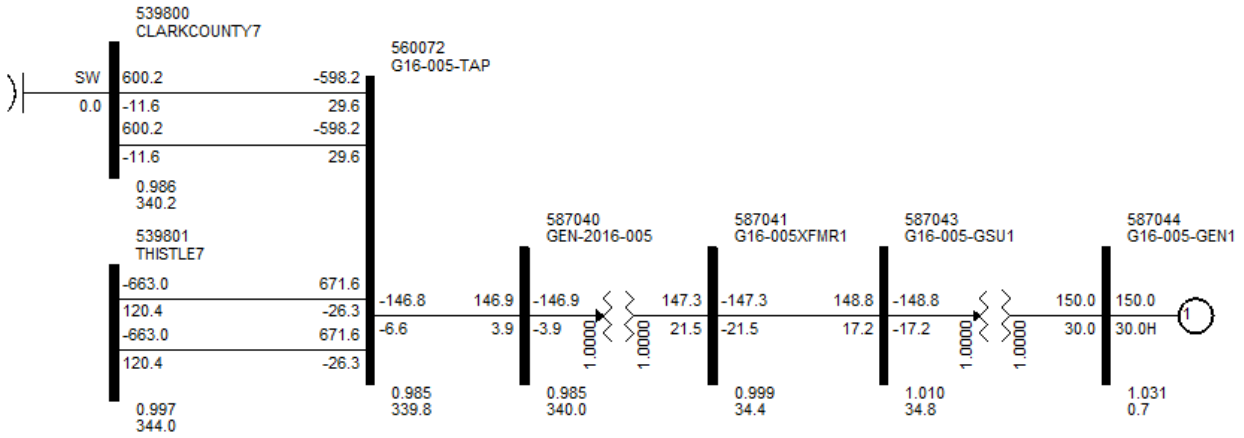
Stand-Alone Scenario Base Cases

- **MDWG15-16WP_DIS1601_G03_SA.sav** – 2016 Winter Peak SA Base Case for Group 3. DISIS-2016-001 interconnection requests currently out of service. Prior queued projects within Group 3 are at 100% output power.
- **MDWG15-17SP_DIS1601_G03_SA.sav** – 2017 Summer Peak SA Base Case for Group 3. DISIS-2016-001 interconnection requests currently out of service. Prior queued projects within Group 3 are at 100% output power.
- **MDWG15-25SP_DIS1601_G03_SA.sav** – 2025 Summer Peak SA Base Case for Group 3. DISIS-2016-001 interconnection requests currently out of service. Prior queued projects within Group 3 are at 100% output power.

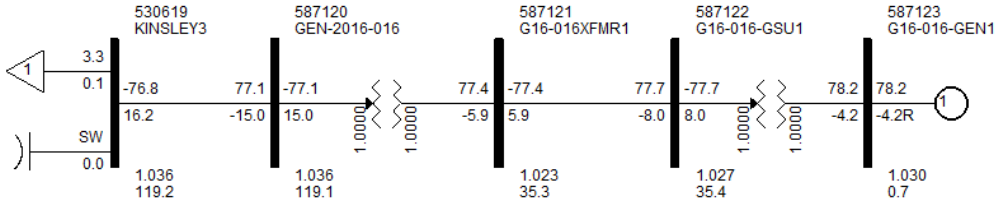
On November 30, 2016, S&C received an IDV file titled "RemoveGEN-2011-016erroneousTransmissionLead.idv" to correct an identified modeling error included in the group 3 base cases provided by SPP. The IDV was applied to each Base Case prior to performing the study.

5. POWER FLOW MODEL

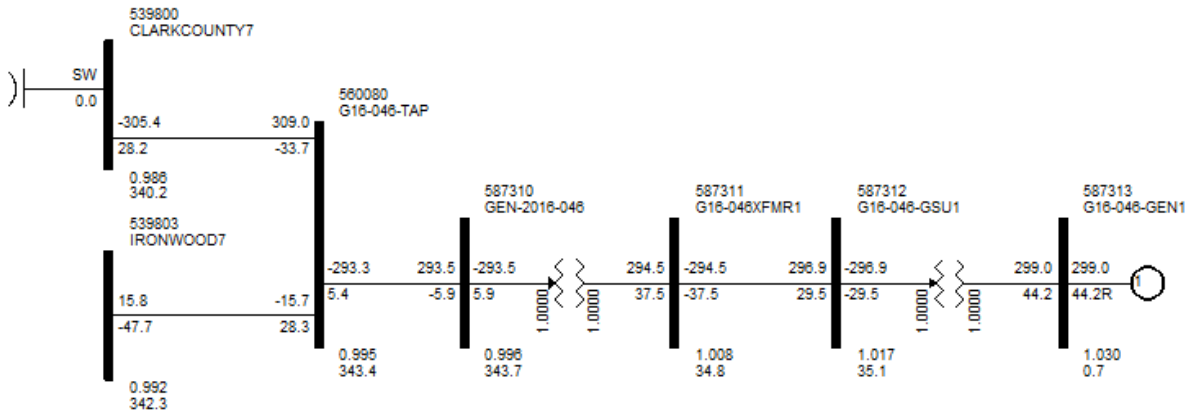
SPP's base case power flow models were built in PSS/E 32.2.1. In PSS/E of the same version, S&C created one-line diagrams depicted in Figure 1 for each interconnection request.



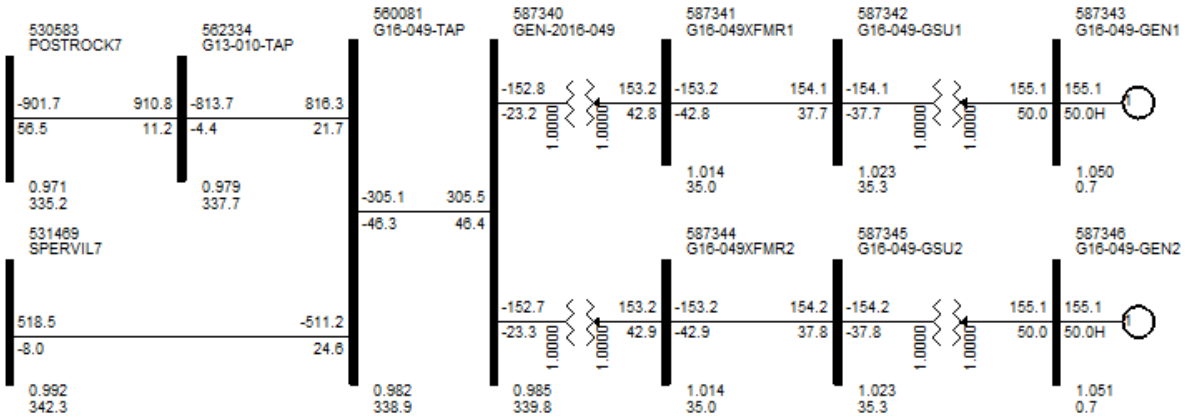
(a) Interconnection request GEN-2016-005



(b) Interconnection request GEN-2016-016



(c) Interconnection request GEN-2016-046



(d) Interconnection request GEN-2016-049

Figure 1: One-line Diagrams of the Interconnection Request Projects

6. DYNAMIC STABILITY ANALYSIS

6.1. ASSUMPTIONS

Dynamic stability analysis was performed for all the SPP contingencies listed in Appendix A. Three phase faults were simulated as bolted faults, while single line-to-ground faults were simulated under the assumption that a single line-to-ground fault will cause a 40% drop in the positive-sequence voltage at the fault location.

6.2. STABILITY CRITERIA

Dynamic stability studies were performed to ensure system stability following critical faults on the system. The system is considered stable if the following conditions are met:

(1) Disturbances including three-phase and single-phase to ground faults, should not cause synchronous and asynchronous plants to disconnect from the transmission grid.

(2) The angular positions of synchronous machine rotor become constant following an aperiodic system disturbance.

(3) Voltage magnitudes and frequencies at terminals of asynchronous generators should not exceed magnitudes and durations that will cause protection elements to operate. Furthermore, the response after the disturbance needs to be studied at the terminals of the machine to ensure that there are no sustained oscillations in power output, speed, frequency, etc.

(4) Voltage magnitudes and angles after the disturbance should settle to a constant and acceptable operating level. Frequencies should settle to the acceptable range within nominal 60 Hz power frequency.

In addition, performance of the transmission system is measured against the SPP Disturbance Criteria Requirements on Angular oscillations and Transient Voltage Recovery, detailed in Appendix B.

6.3. DYNAMIC STABILITY RESULTS

Some concerns surfaced during preliminary dynamic stability simulations. A detailed list of such concerns and how they were addressed is shown below.

- Low voltage conditions were observed near GEN-2016-005, GEN-2016-046 and GEN-2016-049 during initial power flow solutions. Furthermore, simulation of FLTs 11-14 caused PSS/E to crash.
    - To resolve the issue, SPP provided an IDV file titled "Disable_reactors.idv" to set the Base Case initial state of each reactor bank to 0 MVAR for various reactors in the surrounding area. The reactors were located at the following stations: Axtell, Beaver County, Border, Buckner, Clark County, Holcomb, Mingo, Post Rock, Spearville, Thistle, Setab, Wichita, & Woodward EHV.
    - In addition, SPP also provided an IDV file titled "Increase_Qgen_GEN-2011-008_V32.IDV" to increase the cumulative reactive power set point of Prior Queued Project GEN-2011-008 to $Q_{GEN}=Q_{MAX}=Q_{MIN}=105$ Mvar.
    - The "Increase_Qgen_GEN-2011-008_V32.IDV" file was also utilized to eliminate power oscillation concerns that later surfaced with Prior Queued Project GEN-2011-008

- Relay SLNOS #1 protecting line 523853-531449 was causing tripping during FLT23 and FLT24 in 2017SP
    - To resolve the issue, this relay was removed from service
    - The Transmission Owner(s) should review the relay settings on this line during the facility study for Group 3.

Dynamic stability simulations were performed once again after implementing the solutions described above. Table 3 below summarizes the dynamic stability results for each contingency and each season.

Given the adjustments mentioned, dynamic stability analysis thus concluded that Group 3 is expected to successfully ride-through all contingencies specified by SPP and the nearby areas retained frequency and voltage stability. Detailed plots of cluster dynamic stability results for each contingency and each peak season, are given in Appendix C. Plots of stand-alone dynamic stability result for each contingency and each season are given Appendix D.

7. POWER FACTOR ANALYSIS

The power factor analysis was performed under the cluster bases and for all N-1 three-phase contingencies shown in the Fault Definition table in Appendix A. Single-phase contingencies, N-1-1 contingencies and N-2 contingencies were excluded from the study. Prior to the run, the cluster base cases were slightly altered, by turning off the renewable energy projects and replacing them by a generator at the high voltage bus with the MW rating of the renewable project at that POI and no var capability. A new var generator was placed at each renewable energy project high voltage bus for supporting the reactive power. The var generators were set to hold the voltage schedule at the interconnection project consistent with the voltage schedules in the provided base case or 1.0 p.u. voltage, whichever is higher. Table 4 gives the voltage schedule at each interconnection request location in the original cluster base cases.

Table 4: Base Case Voltages at the Interconnection Request POI Bus

Request	POI	2016 Winter Peak (p.u.)	2017 Summer Peak (p.u.)	2025 Summer Peak (p.u.)
GEN-2016-005	560072	0.968	0.931	0.940
GEN-2016-016	530619	1.036	1.020	1.022
GEN-2016-046	560080	0.981	0.951	0.958
GEN-2016-049	560081	0.974	0.950	0.963

The power factor analysis results for Group 3 interconnection requests for each N-1 three phase contingency were presented in Appendix E. We marked in pink color the contingencies at which the required power factor at the POI of the study project is beyond the normal required capability (from 0.95 lagging to 0.95 leading) of the studied renewable energy project. We also provided a summary Table 5 of the maximum leading/lagging reactive power demand and power factor found by the power factor analysis at the POIs.

The power factor requirement for GEN-2016-005, GEN-2016-016, GEN-2016-046, and GEN-2016-049 interconnection requests is from 0.95 lagging to 0.95 leading power factor at the POIs.

Table 5: Summary of Power Factor Analysis at the POI

Request	Capacity	POI	Reactive Power/Power Factor at the POI	
			Leading (absorbing vars)	Lagging (providing vars)
GEN-2016-005	150 MW	560072	N/A	690.9 Mvar / 0.210
GEN-2016-016	78.2 MW	530619	-17.9 Mvar / 0.975	N/A
GEN-2016-046	299 MW	560080	-92.5 Mvar / 0.955	105 Mvar / 0.943
GEN-2016-049	310.2 MW	560081	-42.4 Mvar / 0.991	270.1 Mvar / 0.753

NOTE: Per the SPP Tariff as reactive power is required for all projects, the final requirement in the GIA will be the pro-forma 95% lagging to 95% leading at the point of interconnection.

8. Low Wind/Low Solar irradiance Conditions Analysis

S&C has performed an analysis of low wind/low solar irradiance conditions for the interconnection requests that is a renewable energy project. The low wind/low solar irradiance analysis was performed under the Cluster scenarios by taking the interconnection renewable energy project out of service and placing a shunt reactor at the project substation high side to offset the reactive power generated from the capacitance of the project's transmission lines and collector cables. The size of the shunt reactor was adjusted such that the net Mvar flow into the POI from the studied renewable energy project was approximately zero. Table 6 gives the shunt reactor Mvars for the studied projects.

Table 6: Shunt Reactor Mvar Determined by Low Wind/Low Irradiance Study

Request	POI	2016 Winter Peak	2017 Summer Peak	2025 Summer Peak
GEN-2016-005	560072	9.6	9.6	9.6
GEN-2016-016	530619	2.7	2.7	2.7
GEN-2016-046	560080	13.9	13.9	13.9
GEN-2016-049	560081	16.0	16.0	16.0

9. SHORT-CIRCUIT STUDY

A short-circuit study has been performed on the power flow models for the 2017 SP and 2025 SP Seasons for each generator using the Cluster Scenario model. Short-circuit analysis includes applying a 3-phase fault on buses up to 5 levels away from the POI of each interconnection request project. PSS/E "Automatic Sequence Fault Calculation (ASCC)" fault analysis module was used for the purpose of short-circuit analysis. The results of the short-circuit analysis have been recorded for all the buses up to five levels away from the point of interconnection of each interconnection request project. Detailed results of the short-circuit study are provided in Appendix F.

10. CONCLUSIONS AND RECOMMENDATIONS

With the adjustments mentioned in Section 6, Group 3's dynamic results (Cluster and Stand-Alone) indicated that the interconnection request projects are expected to successfully ride through all N-1, N-1-1 and N-2 fault contingencies specified in appendix A, retaining angular, frequency and voltage stability at the nearby areas and meeting the transient voltage recovery requirement by SPP. It is thus concluded that Group 3 study projects are expected to successfully interconnect into the transmission system at their desired locations for 100% power outputs.

The results of power factor analysis indicate that all the interconnection requests are required to maintain a power factor of 0.95 lagging to 0.95 leading at the POI to meet SPP's requirements.

The project's low wind/low solar irradiance study suggested that to offset the reactive power from the capacitance of the project's transmission lines and collector cables during the low wind/low irradiance conditions, a 9.6 Mvar shunt reactor size is required for the GEN-2016-005 substation high voltage side bus, 2.7 Mvar for GEN 2016 016, 13.9 Mvar for GEN-2016-046, and 16.0 Mvar for GEN 2016 049.

A short-circuit study has been performed on the power flow models for the 2017 Summer Peak Season and 2025 Summer Peak Season for each generator using the Cluster Scenario model. A 3-phase fault is applied on buses up to 5 levels away from the POI of each interconnection request project and the results of the study have been presented.

APPENDIX A

SPP GROUP 3 FAULT DEFINITIONS

Fault Definitions

Cont. No.	Cont. Name	Description
1	FLT01-3PH	3 phase fault on G16-005-TAP 345 kV (560072) to CLARKCOUNTY7 345 kV (539800) CKT 1, near G16-005-TAP. a. Apply fault at the G16-005-TAP 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
2	FLT02-3PH	3 phase fault on G16-005-TAP 345 kV (560072) to THISTLE7 345 kV (539801) CKT 1, near G16-005-TAP. a. Apply fault at the G16-005-TAP 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
3	FLT03-3PH	3 phase fault on the THISTLE7 345 kV (539801) to THISTLE4 138 kV (539804) to THISTLE T1 13.8 kV (539802) XFMR, near THISTLE7 345 kV. a. Apply fault at the THISTLE7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted transformer.
4	FLT04-3PH	3 phase fault on THISTLE7 345 kV (539801) to G1524&G1525T 345 kV (560033) CKT 1, near THISTLE7. a. Apply fault at the THISTLE7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
5	FLT05-3PH	3 phase fault on THISTLE7 345 kV (539801) to WWRDEHV7 345 kV (515375) CKT 1, near THISTLE7. a. Apply fault at the THISTLE7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
6	FLT06-SB	**Stuck Breaker at G16-005-TAP (560072)** a. Apply single phase fault at G16-005-TAP. b. Clear fault after 16 cycles and trip the following elements c. G16-005-TAP (560072) - CLARKCOUNTY7 (539800), CKT 1 d. G16-005-TAP (560072) - THISTLE7 (539801), CKT 1
7	FLT07-SB	**Stuck Breaker at THISTLE7 (539801)** a. Apply single phase fault at THISTLE7 bus. b. Clear fault after 16 cycles and trip the following elements c. THISTLE7 (539801) - G16-005-TAP (560072), CKT 1 d. THISTLE7 (539801) - G1524&G1525T (560033), CKT 1

Fault Definitions

Cont. No.	Cont. Name	Description
8	FLT08-SB	**Stuck Breaker at THISTLE7 (539801)** a. Apply single phase fault at THISTLE7 bus. b. Clear fault after 16 cycles and trip the following elements c. THISTLE7 (539801) - G16-005-TAP (560072), CKT 1 d. THISTLE7 345kV (539801) / THISTLE4 138 kV (539804) / THISTLE T1 13.8 kV (539802) transformer
9	FLT09-SB	**Stuck Breaker at THISTLE7 (539801)** a. Apply single phase fault at THISTLE7 bus. b. Clear fault after 16 cycles and trip the following elements c. THISTLE7 (539801) - G16-005-TAP (560072), CKT 1 d. THISTLE7 (539801) - WWRDEHV7 (515375), CKT 1
10	FLT10-SB	**Stuck Breaker at CLARKCOUNTY7 (539800)** a. Apply single phase fault at CLARKCOUNTY7. b. Clear fault after 16 cycles and trip the following elements c. CLARKCOUNTY7 (539800) - G16-005-TAP (560072) d. CLARKCOUNTY7 (539800) - IRONWOOD7 (560002)
11	FLT11-PO	**Prior Outage of G16-005-TAP (560072) to CLARKCOUNTY7 (539800), CKT 1;** 3 phase fault on G16-005-TAP (560072) –THISTLE7 (539801), CKT 1 near G16-005-TAP a. Apply fault at the G16-005-TAP bus. b. Clear fault after 5 cycles and trip the faulted line.
12	FLT12-PO	**Prior Outage of THISTLE7 (539801) - G16-005-TAP (560072), CKT 1;** 3 phase fault on THISTLE7 (539801) - G1524&G1525T (560033), CKT 1 near THISTLE7 a. Apply fault at the THISTLE7 bus. b. Clear fault after 5 cycles and trip the faulted line.
13	FLT13-PO	**Prior Outage of THISTLE7 (539801) - G16-005-TAP (560072), CKT 1;** 3 phase fault on THISTLE7 345kV (539801) / THISTLE4 138 kV (539804) / THISTLE T1 13.8 kV (539802) transformer near THISTLE7 a. Apply fault at the THISTLE7 bus. b. Clear fault after 5 cycles and trip the faulted transformer.
14	FLT14-PO	**Prior Outage of THISTLE7 (539801) - G16-005-TAP (560072), CKT 1;** 3 phase fault on THISTLE7 (539801) - WWRDEHV7 (515375), CKT 1 near THISTLE7 a. Apply fault at the THISTLE7 bus. b. Clear fault after 5 cycles and trip the faulted line.
15	FLT15-PO	**Prior Outage of CLARKCOUNTY7 (539800) - G16-005-TAP (560072), CKT 1;** 3 phase fault on CLARKCOUNTY7 (539800) - IRONWOOD7 (560002) near CLARKCOUNTY7 a. Apply fault at the CLARKCOUNTY7 bus. b. Clear fault after 5 cycles and trip the faulted line.

Fault Definitions

Cont. No.	Cont. Name	Description
16	FLT16-3PH	3 phase fault on ST JOHN3 115 kV (530624) to ST-JOHN3 115 kV (539696), near ST JOHN3. a. Apply fault at the ST JOHN3 115 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
17	FLT17-3PH	3 phase fault on ST JOHN3 115 kV (530624) to HUNTSVL3 115 kV (530618), near ST JOHN3. a. Apply fault at the ST JOHN3 115 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
18	FLT18-SB	**Stuck Breaker at ST-JOHN3 (539696)** a. Apply single phase fault at ST-JOHN3. b. Clear fault after 16 cycles and trip the following elements c. ST-JOHN3 (539696) - NINNESC3 (539648) d. ST-JOHN3 (539696) - SEWARD 3 (539692)
19	FLT19-SB	**Stuck Breaker at ST-JOHN3 (539696)** a. Apply single phase fault at ST-JOHN3. b. Clear fault after 16 cycles and trip the following elements c. ST-JOHN3 (539696) - ST JOHN3 (530624) d. ST-JOHN3 (539696) - SEWARD 3 (539692)
20	FLT20-SB	**Stuck Breaker at ST-JOHN3 (539696)** a. Apply single phase fault at ST-JOHN3. b. Clear fault after 16 cycles and trip the following elements c. ST-JOHN3 (539696) - ST JOHN3 (530624) d. ST-JOHN3 (539696) - NINNESC3 (539648)
21	FLT21-PO	**Prior Outage of ST-JOHN3 (539696) - NINNESC3 (539648) line;** 3 phase fault on ST-JOHN3 (539696) - SEWARD 3 (539692) near ST-JOHN3 a. Apply fault at the ST-JOHN3 bus. b. Clear fault after 5 cycles and trip the faulted line.
22	FLT22-PO	**Prior Outage of ST-JOHN3 (539696) - ST JOHN3 (530624) line;** 3 phase fault on ST-JOHN3 (539696) - SEWARD 3 (539692) near ST-JOHN3 a. Apply fault at the ST-JOHN3 bus. b. Clear fault after 5 cycles and trip the faulted line.
23	FLT23-3PH	3 phase fault on G16-046-TAP 345 kV (560080) to CLARKCOUNTY7 345 kV (539800), near G16-046-TAP. a. Apply fault at the G16-046-TAP 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Fault Definitions

Cont. No.	Cont. Name	Description
24	FLT24-3PH	3 phase fault on G16-046-TAP 345 kV (560080) to IRONWOOD7 345 kV (539803), near G16-046-TAP. a. Apply fault at the G16-046-TAP 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
25	FLT25-3PH	3 phase fault on CLARKCOUNTY7 345 kV (539800) to IRONWOOD7 345 kV (560002), near CLARKCOUNTY7. a. Apply fault at the CLARKCOUNTY7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
26	FLT26-SB	**Stuck Breaker at CLARKCOUNTY7 (539800)** a. Apply single phase fault at CLARKCOUNTY7. b. Clear fault after 16 cycles and trip the following elements c. CLARKCOUNTY7 (539800) - G16-046-TAP (560080) d. CLARKCOUNTY7 (539800) - IRONWOOD7 (560002)
27	FLT27-SB	**Stuck Breaker at CLARKCOUNTY7 (539800)** a. Apply single phase fault at CLARKCOUNTY7. b. Clear fault after 16 cycles and trip the following elements c. CLARKCOUNTY7 (539800) - G16-046-TAP (560080) d. CLARKCOUNTY7 (539800) - G16-005-TAP (560072), CKT 1
28	FLT28-PO	**Prior Outage of CLARKCOUNTY7 (539800) - G16-046-TAP (560080) line;** 3 phase fault on CLARKCOUNTY7 (539800) - IRONWOOD7 (560002) near CLARKCOUNTY7 a. Apply fault at the CLARKCOUNTY7 bus. b. Clear fault after 5 cycles and trip the faulted line.
29	FLT29-PO	**Prior Outage of CLARKCOUNTY7 (539800) - G16-046-TAP (560080) line;** 3 phase fault on CLARKCOUNTY7 (539800) - G16-005-TAP (560072) CKT 1, near CLARKCOUNTY7 a. Apply fault at the CLARKCOUNTY7 bus. b. Clear fault after 5 cycles and trip the faulted line.
30	FLT30-3PH	3 phase fault on G16-049-TAP 345 kV (560081) to G13-010-TAP 345 kV (562334), near G16-049-TAP. a. Apply fault at the G16-049-TAP 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Fault Definitions

Cont. No.	Cont. Name	Description
31	FLT31-3PH	3 phase fault on G16-049-TAP 345 kV (560081) to SPERVIL7 345 kV (531469), near G16-049-TAP. a. Apply fault at the G16-049-TAP 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
32	FLT32-3PH	3 phase fault on G13-010-TAP 345 kV (562334) to POSTROCK7 345 kV (530583), near G13-010-TAP. a. Apply fault at the G13-010-TAP 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
33	FLT33-3PH	3 phase fault on POSTROCK7 345 kV (530583) to G16-050-TAP 345 kV (560082), near POSTROCK7. a. Apply fault at the POSTROCK7345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
34	FLT34-3PH	3 phase fault on the POSTROCK7 345 kV (530583) to POSTROCK6 230 kV (530584) to POSTROCK1 13.8 kV (530673) XFMR, near POSTROCK7 345 kV. a. Apply fault at the POSTROCK7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted transformer.
35	FLT35-3PH	3 phase fault on the SPERVIL7 345 kV (531469) to SPEARVL6 230 kV (539695) to SPERTER1 13.8 kV (531468) XFMR, near SPERVIL7 345 kV. a. Apply fault at the SPERVIL7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted transformer.
36	FLT36-3PH	3 phase fault on SPERVIL7 345 kV (531469) to BUCKNER7 345 kV (531501), near SPERVIL7 345 kV. a. Apply fault at the SPERVIL7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
37	FLT37-3PH	3 phase fault on the SPERVIL7 345 kV (531469) to SPRVL 3 115 kV (539759) to SPRVL-T 13.8 kV (539960) XFMR, near SPERVIL7 345 kV. a. Apply fault at the SPERVIL7 345 kV bus. b. Clear fault after 5 cycles and trip the faulted transformer.

DYNAMIC STABILITY PLOTS FOR CLUSTER SCENARIO (SUBMITTED IN SEPARATE FILES FROM APPENDIX C-1 TO C-3)

C-1 Group 3 Cluster Dynamic Stability Plots For 2016 Winter Peak Case

C-2 Group 3 Cluster Dynamic Stability Plots For 2017 Summer Peak Case

C-3 Group 3 Cluster Dynamic Stability Plots For 2025 Summer Peak Case

Each contingency consists of (39) subplots:

- Subplot #1 is the system phase angle channels in the snapshot file provided by SPP.
- Subplot #2 to Subplot #31 are results for (30) generators in the scope of study.
- Subplots #32 to Subplot #35 are voltages at the POI buses in the scope of study.
- Subplots #36 to Subplot #39 are frequencies at the POI buses in the scope of study.

SUMMARY

Southwest Power Pool (SPP) has commissioned ABB Inc., to perform a System Impact Study for interconnection request GEN-2016-001 (Group 04) which includes a 73.6 MW wind farm connected at Mingo 345 kV line.

The objective of this study is to evaluate the collective impact of the project on the existing and future planning system. The study is performed on three system scenarios provided by SPP:

- 2016 Winter Peak Case
- 2017 Summer Peak Case
- 2025 Summer Peak Case

FLT28-PO showed instability problem, since the pre-outage and disturbance resulted in outage of two major 345kV outlets. Pre-project cases were created for all three study seasons to simulate the fault, and same condition was observed. Mitigation for this contingency will require the curtailment of GEN-2016-067 and the prior queued projects GEN-2015-065, GEN-2015-064, and GEN-2015-061. For the rest of the studied faults, the simulation results showed no stability problems and no voltage violations for all three seasons. All the simulation results were summarized in Table 2-2 Also, for the contingencies simulated GEN-2016-067 remained on line and, therefore, will comply with FERC Order 661A low voltage ride-through.

System short-circuit current levels at up to five buses away from the point of interconnection were calculated and tabulated for SPP's reference.

Power Factor Analysis was performed to ensure the studied project meets FERC and SPP power factor requirements for wind farm interconnections. Study results show that GEN-2016-067 will be required to meet the SPP pro-forma 95% lagging (providing vars) and 95% leading (absorbing vars) power factor requirements at the Point of Interconnection.

The Low Wind/no wind analysis shows that 2.97 MVAr of shunt reactance is required to bring the MVAr flow at the POI down to approximately zero for all three studied seasons. The reactor bank size is approximate and the final size will be determined in the final facility and collector system design.

The results of this analysis are based on available data and assumptions made at the time of conducting this study. If any of the data and/or assumptions made in developing the study model change, the results provided in this report may not apply.

1 Introduction

Southwest Power Pool (SPP) has commissioned ABB Inc., to perform a Definitive Impact Study for DISIS-2016-001 (Group 04) which includes generation interconnection request GEN-2016-067 (73.6 MW wind farm connected to Mingo 345kV line) as shown in Table 1-1.

Table 1-1 Group 04 Generation Interconnection Requests

Request	Size (MW)	Wind Turbine Model	Point of Interconnection
GEN-2016-067	73.6	Siemens 2.3MW	Mingo 345kV (531451)

The objective of this study is to evaluate the impact of project GEN-2016-067 on the existing and future planning system. The study is performed on three system scenarios provided by SPP:

- 2016 Winter Peak Case
- 2017 Summer Peak Case
- 2025 Summer Peak Case

SPP provided the study cases for all three system scenarios with the three projects included. One line diagrams of the local area for all three seasons are shown in Figure 1-1. The studied generator is circled red.

Three system scenarios supplied by SPP included the following prior queued projects for Group 04:

Table 1-2 Group 04 Prior Queued Projects

Request	Size (MW)	Wind Turbine Model	Point of Interconnection
GEN-2001-039M	99.0	Vestas V90VCRS 3.0MW	Central Plains 115kV (531485)

2 Study Methodology

In this study, ABB investigated the stability of the system for faults in the vicinity of the proposed plant as defined by SPP. The studied faults involve three-phase transformer faults with normal clearing, three-phase line faults with normal clearing and re-closing test, and single-line-to-ground (SLG) faults with stuck breaker.

2.1 Stability Analysis Methodology

Stability analysis is performed to determine whether the electric system would meet stability criteria following the addition of GEN-2016-067.

Stability analysis was performed using Siemens-PTI's PSS/E dynamics program V32.2.0.

All the faults listed in Table 2-1 were simulated for 20 seconds.

Table 2-1: List of Faults of Stability Analysis

Cont. No.	Cont. Name	Description
1	FLT1-3PH	3 phase fault on the Post Rock 345kV (530583) to Axtell 345kV (640065) CKT 1, near Post Rock. a. Apply fault at the Post Rock 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
2	FLT2-3PH	3 phase fault on the Axtell 345kV (640065) to Sweetwater 345 kV (640374) CKT 1, near Axtell. a. Apply fault at the Axtell 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
3	FLT3-3PH	3 phase fault on the Mingo 345kV (531451) to Red Willow 345kV (640325) CKT 1, near Mingo. a. Apply fault at the Mingo 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Cont. No.	Cont. Name	Description
4	FLT4-3PH	3 phase fault on the Mingo 345kV (531451) to Setab 345kV (531465) CKT 1, near Mingo. a. Apply fault at the Mingo 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
5	FLT5-3PH	3 phase fault on the Setab 345kV (531465) to Holcomb 345kV (531449) CKT 1, near Setab. a. Apply fault at the Setab 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
6	FLT6-3PH	3 phase fault on the Holcomb 345kV (531449) to Buckner 345kV (531501) CKT 1, near Holcomb. a. Apply fault at the Holcomb 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
7	FLT7-3PH	3 phase fault on the Setab 345kV (531465) to Setab 115kV (531464) to Setab 13.8kV (531259) XFMR CKT 1, near Setab 345kV. a. Apply fault at the Setab 345kV bus. b. Clear fault after 5 cycles by tripping the faulted transformer.
8	FLT8-3PH	3 phase fault on the Red Willow 345kV (640325) to Gentleman 345kV (640183) CKT 1, near Red Willow. a. Apply fault at the Red Willow 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
9	FLT9-3PH	3 phase fault on the Red Willow 345kV (640325) to Red Willow 115kV (640326) to Red Willow 13.8kV (640327) XFMR CKT 1, near Red Willow. a. Apply fault at the Red Willow 345kV bus.

Cont. No.	Cont. Name	Description
		b. Clear fault after 5 cycles by tripping the faulted transformer.
10	FLT10-3PH	3 phase fault on the Gentleman 345kV (640183) to Sweetwater 345kV (640374) CKT 1, near Gentleman. a. Apply fault at the Gentleman 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
11	FLT11-3PH	3 phase fault on the Holcomb 345kV (531449) to Finney 345kV (523853) CKT 1, near Holcomb. a. Apply fault at the Holcomb 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
12	FLT12-3PH	3 phase fault on the Holcomb 345kV (531449) to Holcomb 115kV (531448) to Holcomb 13.8kV (531450) XFMR CKT 1, near Holcomb 345kV. a. Apply fault at the Holcomb 345kV bus. b. Clear fault after 5 cycles by tripping the faulted transformer.
13	FLT13-3PH	3 phase fault on the Gentleman 345kV (640183) to Keystone 345kV (640252) CKT 1, near Gentleman. a. Apply fault at the Gentleman 345kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
14	FLT14-3PH	3 phase fault on the Beach 115kV (530557) to Hoxie 115kV (530556) CKT 1, near Beach. a. Apply fault at the Beach 115kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
15	FLT15-3PH	3 phase fault on the Colby 115kV (530555) to Atwood 115kV (530554) CKT 1, near Colby.

Cont. No.	Cont. Name	Description
		a. Apply fault at the Colby 115kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
16	FLT16-3PH	3 phase fault on the Colby 115kV (530555) to Seguin Tap 115kV (530682) CKT 1, near Colby. a. Apply fault at the Colby 115kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
17	FLT17-3PH	3 phase fault on the Colby 115kV (530555) to Mingo 115kV (531429) CKT 1, near Colby. a. Apply fault at the Colby 115kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
18	FLT18-3PH	3 phase fault on the Mingo 115kV (531429) to Pheasant Run 115kV (530559) CKT 1, near Mingo. a. Apply fault at the Mingo 115kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
19	FLT19-3PH	3 phase fault on the Mingo 115kV (531429) to Brewster 115kV (531351) CKT 1, near Mingo. a. Apply fault at the Mingo 115kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
20	FLT20-3PH	3 phase fault on the Mingo 115kV (531429) to Mingo 345kV (531451) to Mingo 13.8kV (531452) XFMR CKT 1, near Mingo 115kV. a. Apply fault at the Mingo 115kV bus.

Cont. No.	Cont. Name	Description
		b. Clear fault after 5 cycles by tripping the faulted transformer.
21	FLT21-3PH	3 phase fault on the Pheasant Run 115kV (530559) to Seguin 115kV (530683) CKT 1, near Pheasant Run. a. Apply fault at the Pheasant Run 115kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
22	FLT22-3PH	3 phase fault on the Pheasant Run 115kV (530559) to Grinnell 115kV (531412) CKT 1, near Pheasant Run. a. Apply fault at the Pheasant Run 115kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
23	FLT23-3PH	3 phase fault on the Gove 115kV (531411) to Arnold 115kV (531409) CKT 1, near Gove. a. Apply fault at the Gove 115kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
24	FLT24-3PH	3 phase fault on the Arnold 115kV (531409) to Ransom 115kV (531414) CKT 1, near Arnold. a. Apply fault at the Arnold 115kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
25	FLT25-3PH	3 phase fault on the Atwood 115kV (530554) to Atwood SW 115kV (531364) CKT 1, near Atwood. a. Apply fault at the Atwood 115kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.

Cont. No.	Cont. Name	Description
26	FLT26-3PH	3 phase fault on the Atwood 115kV (530554) to Beaver Valley 115kV (531488) CKT 1, near Atwood. a. Apply fault at the Atwood 115kV bus. b. Clear fault after 5 cycles by tripping the faulted line. c. Wait 20 cycles, and then re-close the line in (b) back into the fault. d. Leave fault on for 5 cycles, then trip the line in (b) and remove fault.
27	FLT27-PO	**Prior Outage of Mingo to Brewster 115kV**. 3 phase fault on the Mingo – Pheasant Run 115kV line. a. Prior outage Mingo (531429) 115kV to Brewster (531351) 115kV (solve network for steady state solution). b. 3 phase fault on the Mingo (531429) 115kV to Pheasant Run (530559) 115kV, near Mingo 115kV. c. Leave fault on for 5 cycles, then trip the faulted line in (b).
28	FLT28-PO	**Prior Outage of Mingo to Red Willow 345kV**. 3 phase fault on the G15-061-Tap – Setab 345kV line. a. Prior outage Mingo (531451) 345kV to Red Willow (640325) 345kV (solve network for steady state solution). b. 3 phase fault on the Mingo (531451) 345kV to Setab (531465) 345kV, near G15-051-Tap 345kV. c. Leave fault on for 5 cycles, then trip the faulted line in (b).
29	FLT29-PO	**Prior Outage of Setab to Mingo 345kV**. 3 phase fault on the Mingo – Colby 115kV line. a. Prior outage Setab (531465) 345kV to Mingo (531451) 345kV (solve network for steady state solution). b. 3 phase fault on the Mingo (531429) 115kV to Colby (530555) 115kV, near Mingo 115kV. c. Leave fault on for 5 cycles, then trip the faulted line in (b).
30	FLT30-SB	**Mingo 115kV Stuck Breaker** a. Apply single phase fault at the Mingo (531429)115kV bus on the Mingo – Brewster (531351) 115kV line. b. Wait 16 cycles, and then trip Mingo (531429) to Brewster (531351) 115kV. c. Trip Mingo (531429) to Colby (530555) 115kV and remove the fault.

Cont. No.	Cont. Name	Description
31	FLT31-SB	**Mingo 345kV Stuck Breaker** a. Apply single phase fault at the Mingo (531451) 345kV bus on the Mingo – Red Willow (640325) 345kV line. b. Wait 16 cycles, and then trip Mingo (531451) to Red Willow (640325) 345kV. c. Trip Mingo (531451) 345kV to Mingo (531429) 115kV to Mingo (531452) 13.8kV transformer and remove the fault.
32	FLT32-SB	**Holcomb 345kV Stuck Breaker** a. Apply single phase fault at the Holcomb (531449) 345kV bus on the Holcomb – Buckner (531501) 345kV line. b. Wait 16 cycles, and then trip Holcomb (531449) to Buckner (531501) 345kV. c. Trip Holcomb (531449) 345kV to Holcomb (531448) 115kV to Holcomb (531450) 13.8kV transformer and remove the fault.

Single-line-to-ground faults were simulated with the standard method of applying fault impedance to the positive sequence network to represent the effect of the negative and zero sequence networks on the positive sequence network. The SLG fault impedance was computed by assuming a positive sequence voltage at the fault location at approximately 60% of pre-fault voltage, which is a typical value.

The Southwest Pool Disturbance Performance Criteria Requirements in Appendix A were used to evaluate the system response during the initial transient period following a disturbance on the system. Generator response and bus voltages (115 kV and above) in Area 520, 524, 525, 526, 531, 534, 536 and 640 were monitored to ensure the system performance meets criteria requirements. Rotor angles of the nearby synchronous machines were investigated to make sure they maintained synchronism and had adequate damping following system faults.

Any wind generator must comply with FERC Order 661A on low voltage ride through requirements for wind farms. Therefore, the wind generators should not be tripped off line for faults by under voltage relay actuation. Generator speed of pre-queued projects was also monitored to ensure they stay online under system contingencies. For contingencies that result in a prior queued project tripping off-line; the contingency shall be re-run with the prior queued project's voltage and frequency tripping disabled.

2.2 Study Results -

One prior outage case (FLT28-PO) showed instability problem. This condition exists with or without the GEN-2015-067 interconnection.

It is observed for FLT28-PO (prior outage at 345kV Mingo – 345kV Red Willow with 3-ph fault on 345kV Mingo to 345kV Setab line) could result in voltage collapse at Mingo 345kV. This is due to loss of two major 345 kV lines (Mingo – Red Willow 345kV and Mingo - Setab 345 kV) that were interconnected to the prior queued projects GEN-2015-065 (200MW) & GEN-2015-061 (200MW). Also, the transformers at Mingo 345 kV were not rated to transfer this generation. . In a discussion with SPP the prior queued projects GEN-2015-065, GEN-2015-064, and GEN-2015-061 were studied in DISIS-2015-002 Group 4 and demonstrated the same instability for the prior outage at 345kV Mingo – 345kV Red Willow with 3-ph fault on 345kV Mingo to 345kV Setab line. Mitigation for this contingency will require the curtailment of GEN-2016-067 and the prior queued projects GEN-2015-065, GEN-2015-064, and GEN-2015-061.

.

For the rest of the studied faults, the simulation results showed no stability problems and no voltage violations for all three seasons. Also, for the contingencies simulated GEN-2016-067 remained on line and, therefore, will comply with FERC Order 661A low voltage ride-through.

All fault results are summarized in Table 2-2, which show results for the 2016 Winter Peak case, the 2017 Summer Peak case, and the 2025 Summer Peak case, respectively. The "Voltage Violation" in the table refers to "*bus voltages on the Bulk Electric System is below 0.70 per unit, after the fault is cleared or bus voltages is above 1.20 per unit after the fault is cleared*". Any voltage violations are highlighted with **red**.

* Requires curtailment of GEN-2016-067 and prior queued projects GEN-2015-065, GEN-2015-064, and GEN-2015-061 after the prior outage.

3 Short Circuit Analysis

Short circuit analysis was performed on the 2017 Summer Peak and 2025 Summer Peak power flow case using the PSS/E program. Since the power flow model does not contain negative and zero sequence data, only three-phase symmetrical fault current levels were calculated at up to five buses away from the point of interconnection.

Table 3-1 tabulates all the three-phase fault current levels, and the calculated values were listed here for SPP's reference.

4 Power Factor Analysis

Since the studied project is a renewable energy project, power factor analysis was performed on three provided cluster scenarios upon SPP's request.

4.1 Power Factor Analysis Methodology

Power Factor Analysis was performed for the studied wind farm under system intact and contingency conditions. All N-1, three phase stability faults shown in Table 2-1 were analyzed as power flow contingencies. The power factor requirements for the wind farm were determined to maintain the voltage at the POI to the schedule voltage which is the higher of the POI voltage in the provided base case or 1.0 per unit. Fictitious var generator was added to the studied wind farm to maintain the scheduled voltage following all studied contingencies. The MW and Mvar injections from the studied wind farm at the POI were recorded and the power factors were calculated for all contingencies. The most lagging and most leading power factors determine the minimum power factor range capability required for the studied wind farm.

If more than one studied project share the same POI, the projects were grouped together and common power factor requirements were determined for this group of studied projects. With this method, none of the studied projects is required to provide more or less than its fair share of the reactive power requirements at the same POI. If a prior-queued project is connected at the same POI as the studied project, the prior-queued project was not grouped with the studied project since its reactive power requirements was determined in previous studies. However, the voltage schedules of the prior-queued project and the studied project at the same POI were coordinated and the local existing capacitor banks were set to their maximum capability, if necessary.

Per FERC and SPP requirements, if the power factor needed to maintain the scheduled voltage is less than 0.95 lagging or leading, the requirements is limited to 0.95 lagging or leading.

If the required power factor at the POI is beyond the capability of the studied wind turbine, the approximate size of the additional capacitors were determined.

4.2 Study Results

Table 4-1 summarizes the power factor analysis results. The detailed power factor analysis results for each studied contingency are provided in Appendix C. Per SPP and FERC requirements, the generating facility shall be designed to meet the requirement of 95% lagging (providing vars) and 95% leading (absorbing vars) to the Point of Interconnection.

The detailed power factor analysis results for each studied contingency are provided in Appendix C.

Table 4-1 Power Factor Analysis Results

Request	Size	Generator	POI	Scenario	PF Analysis Worst Scenario		Final PF Requirement	
	(MW)	Model			Leading[1]	Lagging[2]	Leading[1]	Lagging[2]
GEN-2016-067	73.6	Siemens 2.3MW	Mingo 345kV (531451)	16WP	0.971	0.999	0.95	0.95
				17SP	0.969	1.000	0.95	0.95
				25SP	0.981	0.999	0.95	0.95

Notes:

1. Leading is when the generator is absorbing reactive power from the transmission grid.
2. Lagging is when the generator is providing reactive power to the transmission grid.

5 Low Wind/No Wind Analysis

In this study, ABB investigated the GEN-2016-067 project for low wind/no wind conditions, since the interconnected wind farms are connected to 345kV buses.

5.1 Low/No Wind Analysis Methodology

Low wind/No wind analysis is performed to determine the required shunt reactor size at the study project substation high side buses to bring the MVAr flows into the POIs down to approximately zero.

For each studied scenario, the studied wind generators and capacitor bank (none in this case) were switched out of service with the collector system as modeled remaining in service. The resulting reactive power injection into the transmission network coming from the capacitance of the project's transmission lines and collector cables was measured. Then, the required shunt reactor size was calculated to bring the MVAr flows into the POIs down to approximately zero.

5.2 Study Results

Table 5-1 summaries the Low/No Wind analysis results. It is shown that 2.97 MVAr shunt reactors at the substation high side bus (585030) are required to bring the MVAr flows in the POI down to approximately zero under low/no wind conditions for all three studied seasons. The reactor bank size is approximate to be finalized during final facility and collector system design.

Table 5-1 (a): Low/No Wind Analysis Results for POI of GEN-2016-067

Scenario	Reactive Power Injection at POI (MVAr)	Bus 585030 Volt (pu)	Required Shunt Reactor (MVAr)
16WP	3.09	1.0186	**2.97**
17SP	3.09	1.0188	**2.97**
25SP	3.07	1.0164	**2.97**

6 Conclusions

Southwest Power Pool (SPP) has commissioned ABB Inc., to perform a Definitive Impact Study for DISIS-2016-001 (Group 04) which includes generation interconnection requests GEN-2016-067 (73.6 MW wind farm connected at Mingo 345 kV line).

Request	Size (MW)	Generator Model	POI
GEN-2016-067	73.6	Siemens 2.3MW	Mingo 345kV (531451)

The objective of this study is to evaluate the collective impact of the project on the existing and future planning system. The study is performed on three system scenarios provided by SPP:

- 2016 Winter Peak Case
- 2017 Summer Peak Case
- 2025 Summer Peak Case

FLT28-PO showed instability problem, since the pre-outage and disturbance resulted in outage of two major 345kV outlets. Pre-project cases were created for all three study seasons to simulate the fault, and same condition were observed. For the rest of the studied faults, the simulation results showed no stability problems and no voltage violations for all three seasons. All the simulation results were summarized in Table 2-2. Also, for the contingencies simulated GEN-2016-067 remained on line and, therefore, will comply with FERC Order 661A low voltage ride-through.

System short-circuit current levels at up to five buses away from the point of interconnection were calculated and tabulated for SPP's reference.

Power Factor Analysis was performed to ensure the studied project meets FERC and SPP power factor requirements for wind farm interconnections. Study results show that GEN-2016-067 will be required to meet the SPP pro-forma 95% lagging (providing vars) and 95% leading (absorbing vars) power factor requirements at the Point of Interconnection.

The Low Wind/no wind analysis shows that 2.97 MVAr of shunt reactance is required to bring the MVAr flow at the POI down to approximately zero for all three studied seasons. The reactor bank size is approximate and the final size will be determined in the final facility and collector system design.

The results of this analysis are based on available data and assumptions made at the time of conducting this study. If any of the data and/or assumptions made in developing the study model change, the results provided in this report may not apply.

APPENDIX A SOUTHWEST POWER POOL DISTURBANCE PERFORMANCE CRITERIA REQUIREMENTS

OVERVIEW

These Disturbance Performance Requirements ("Requirements") shall be applicable to the Bulk Electric System within the Southwest Power Pool Planning Area. Utilization of these Requirements applies to all registered entities within the Southwest Power Pool Planning Area. These Requirements shall not be applicable to facilities that are not part of Bulk Electric System. More stringent Requirements are at the sole discretion of each Transmission Owner.

Transient and dynamic stability assessments are generally performed to assure adequate avoidance of loss of generator synchronism and prevention of system voltage collapse within the first 20 seconds after a system disturbance. These Requirements provide a basis for evaluating the system response during the initial transient period following a disturbance on the Bulk Electric System by establishing minimum requirements for machine rotor angle damping and transient voltage recovery.

ROTOR ANGLE DAMPING REQUIREMENT

Machine Rotor Angles shall exhibit well damped angular oscillations [as defined below] and acceptable power swings following a disturbance on the Bulk Electric System for all NERC Category A, B and C events.

Well damped angular oscillations shall meet one of the following two requirements when calculated directly from the rotor angle:

1. Successive Positive Peak Ratio (SPPR) must be less than or equal to 0.95 where SPPR is calculated as follows:

$$SPPR = \frac{\text{Peak Rotor Angle of } 2^{nd} \text{ Positive Swing Peak}}{\text{Peak Rotor Angle of } 1^{st} \text{ Positive Swing Peak}} \leq 0.95$$

   -or- Damping Factor % = (1 – SPPR) x 100% ≥ 5%

   The machine rotor angle damping ratio may be determined by appropriate modal analysis (i.e. Prony Analysis) where the following equivalent requirement must be met:

   Damping Ratio ≥ 0.0081633

2. Successive Positive Peak Ratio Five (SPPR5) must be less than or equal to 0.774 where SPPR5 is calculated as follows:

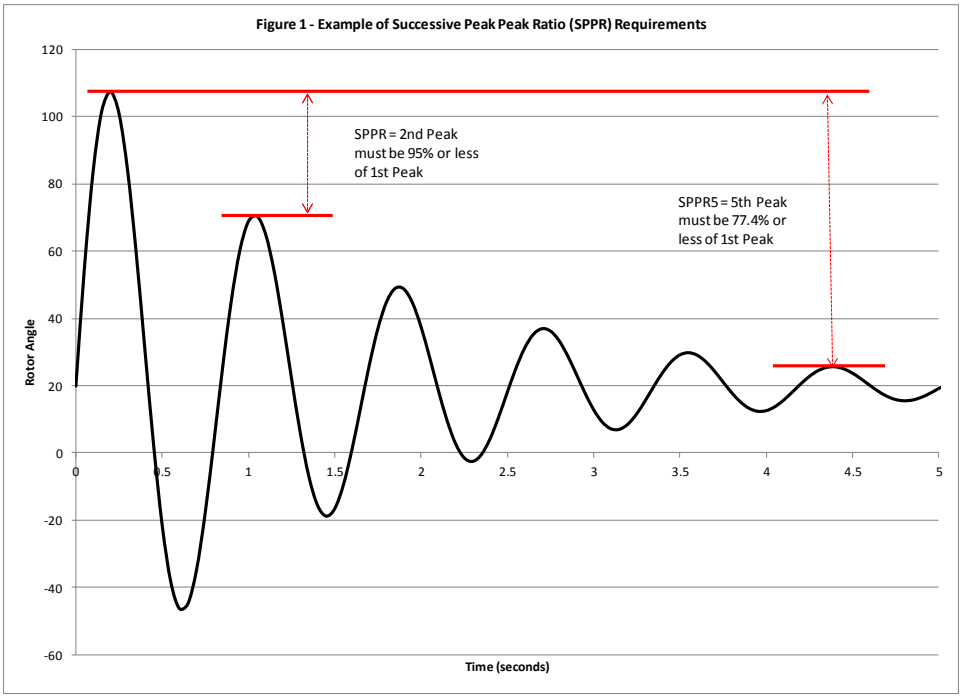
$$SPPR5 = \frac{\text{Peak Rotor Angle of } 5^{th} \text{ Positive Swing Peak}}{\text{Peak Rotor Angle of } 1^{st} \text{ Positive Swing Peak}} \leq 0.774$$

   -or- Damping Factor % = (1 – SPPR5) x 100% ≥ 22.6%

The machine rotor angle damping ratio may be determined by appropriate modal analysis (i.e. Prony Analysis) where the following equivalent requirement must be met:

Damping Ratio ≥ 0.0081633

Qualitatively, these Requirements are shown in Figure 1 below.



TRANSIENT VOLTAGE RECOVERY REQUIREMENT

Any time after a disturbance is cleared; bus voltages on the Bulk Electric System shall not swing outside of the bandwidth of 0.70 per unit to 1.20 per unit.

Qualitatively, this Requirement is shown in Figure 2 below.

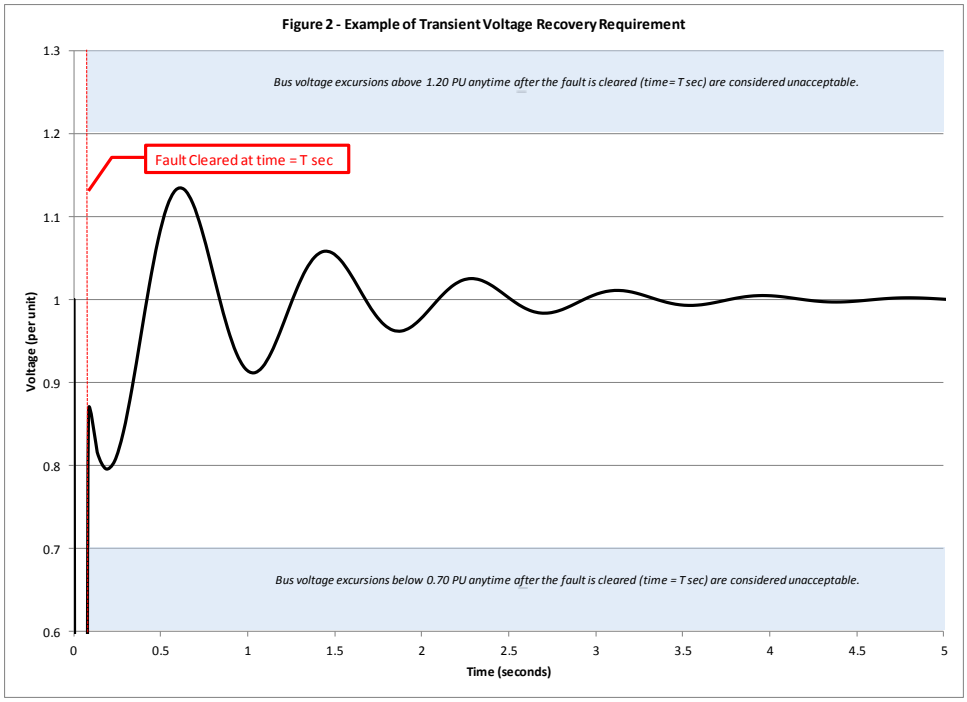


Figure 2 - Example of Transient Voltage Recovery Requirement
Bus voltage excursions above 1.20 PU anytime after the fault is cleared (time= T sec) are considered unacceptable.
Fault Cleared at time = T sec
Bus voltage excursions below 0.70 PU anytime after the fault is cleared (time = T sec) are considered unacceptable.

APPENDIX B POWER FACTOR ANALYSIS RESULTS

All the contingency numbers shown in this appendix match with the fault numbers shown in Table 2-1.

B.1 GEN-2016-067 2016 Winter Peak Case

The GEN-2016-067 POI voltage is 1.0170 pu in the provided 2016 winter peak case. Therefore, the power factor requirements for the wind farm were determined to maintain the voltage at 1.0170 pu. The lowest lagging and leading power factors are highlighted in the table below.

Outage No.		MW	Mvar	PF	
System Intact	0	-270.3	52.2	0.982	leading

B.3 GEN-2016-067 2025 Summer Peak Case

The GEN-2016-067 POI voltage is 1.0152 pu in the provided 2025 summer peak case. Therefore, the power factor requirements for the wind farm were determined to maintain the voltage at 1.0152 pu. The lowest lagging and leading power factors are highlighted in the table below.

Outage No.		MW	Mvar	PF

Title: **DISIS-2016-001 (Group 06) Definitive Impact Study: Final Report REP-0044**
Date: February 2017
Author: Nicholas W. Tenza; Engineer II, Power Systems Engineering Dept. *Nicholas W. Tenza*
Approved: Rajat Majumder; Section Manager, Power Systems Engineering Dept. *Rajat Majumder*

EXECUTIVE SUMMARY

SPP requested a Definitive Interconnection System Impact Study (DISIS). The DISIS required a Stability Analysis, Short Circuit Analysis, Power Factor Analysis, and Low Wind/Irradiance Analysis detailing the impacts of the interconnecting projects as shown in Table ES-1.

Table ES-1
Interconnection Projects Evaluated

Request	Size (MW)	Generator Model	Point of Interconnection
GEN-2015-018	80.0	GE 2.0 MW (wind; 584603)	Tap on Curry County (524822) to Bailey County (525028) 115kV (G15-018T, 560032)
GEN-2015-033	151.8	Vestas V112 3.45 MW (wind; 584763)	Tap on Tuco (525832) – OKU (511456) 345kV (G14-074-TAP, 560027)
GEN-2015-039	50	Eaton Power Xpert Solar 1.67 MW (solar; 584803)	Deaf Smith (524623) to Plant X (525481) 230kV (G15-039-TAP, 560051)
GEN-2015-040	50.1	Eaton Power Xpert Solar 1.67 MW (solar; 584813)	Mustang 230kV (527151)
GEN-2015-041	5 uprate to GEN-2013-016; total power = 196 Summer / 208 Winter	GENROU (583456) (combustion turbine)	Tuco 345kV (525832)

Request	Size (MW)	Generator Model	Point of Interconnection
GEN-2015-078	50.1	Eaton Power Xpert Solar 1.67 MW (solar; 585153)	Mustang 115kV (527146)
ASGI-2016-001	2.5	Envision E110 2.5MW (wind)	Wolfforth 115kV (526524)
ASGI-2016-002	0.35 uprate to ASGI-2015-002; total power = 2.65MW)	GE 2.65MW (584723) (wind)	Hurlwood Substation 69/12.47kV) [Yuma Interchange 115/69kV (526469)]
GEN-2016-002	74	Gamesa G114 2.0MW (wind)	Happy 115 kV substation (525154)
ASGI-2016-004	10	3 x Alstom 3.2MW & 4 x Renewtech 100kW (wind)	Palo Duro 115kV (524530)
GEN-2016-015	100	TMEIC 1.667NW PV inverters (solar)	Andrews 230kV (528604)
GEN-2016-039	112	GE 4.0MW PV inverters (solar)	Swisher 115kV (525212)
GEN-2016-056	200	GE 2.0MW (wind)	Carlisle 230 kV (526161)
GEN-2016-058	200	GE 4.0MW PV inverters (solar)	Yoakum 345kV (526936)
GEN-2016-062	250.7	GE 2.3MW (wind)	Andrews 230kV (528604)
GEN-2016-069	31.35	Hanwha 0.360 MW PV inverters (solar)	Chaves County 115kV (527482)

SUMMARY OF STABILITY ANALYSIS

The Stability Analysis determined that there were multiple contingencies across all seasons that resulted in system/voltage instability, generation tripping offline, and poor post-fault voltage recovery when all generation interconnection requests were at 100% output.

To mitigate the system/voltage instability, voltage violations, generation tripping offline, and poor post-fault steady-state voltages, the following upgrades were provided by SPP and implemented (upgrades provided here are required for 16WP season and thus, implemented in remaining years):

- Crawfish Draw to Seminole 765 kV circuit #1
- Crawfish Draw 765/345 kV transformer 1 & 2
- Seminole 765/345 kV transformer 1 & 2
- Potter County to Grapevine to Chisholm 345 kV circuit #1
- Potter County to Tolk 345 kV circuit #1
- Tolk to Crawfish Draw 345 kV circuit #1
- OKU SVC +300/-100 Mvar (add +200 Mvar)
- Add 200 Mvar Capacitor Bank at OKU 345 kV (550 Mvar capacitor bank total)
- Chaves County – Price – CV Pine – Capitan 115 kV circuit #1
    - Required to be implemented in 16WP and 17SP
    - Line exists in 20WP, 20SP, and 25SP
- Grapevine to Beaver County 345 kV circuit #1
- Beaver County to Clark County 345 kV circuit #1
- Re-terminate the Yoakum to TUCO 345 kV line from TUCO to Crawfish Draw
- TUCO to Crawfish Draw 345 kV circuit #2
- Rio Blanco +300/-100 Mvar SVC

In the 16WP and 20WP seasons, under normal system dispatch, system instability exists for a fault at Crawfish Draw 765 kV that results in the loss of the Crawfish Draw to Seminole 765 kV line. For this reason, it is necessary to limit the flow along the Crawfish Draw to Seminole 765 kV line. The following flow limits are required for the 16WP and 20WP seasons, respectively:

- 16WP Flow Limit on Crawfish Draw to Seminole 765 kV: 1625 MW from Crawfish Draw 765 kV end
- 20WP Flow Limit on Crawfish Draw to Seminole 765 kV: 1395 MW from Crawfish Draw 765 kV end

Several violations exist only in the 20SP, 20WP, and 25SP seasons. Refer below for the additional mitigation required for these seasons (seasons listed in parenthesis for which mitigation is required):

- NA Enrich 115 kV capacitor bank: 28.8 Mvar (20WP, 20SP) (an existing cap bank)
- Drinkard 115 kV capacitor bank: 14.4 Mvar (20WP) (an existing cap bank)
- Additional Andrews to NA Enrich 115 kV circuit #2
- Seminole to Mustang 115 kV circuit #1 (25SP)
- Hereford 115 kV capacitor bank: 25 Mvar (25SP) (a new cap bank)

Note for GEN-2016-015, for a three-phase fault at the point of interconnection (Andrews 230 kV), the TMEIC photovoltaic inverter model (ITMEIC) tripped offline due to over frequency protection and over voltage protection. For this study, the over frequency and over voltage protection were set to 75 Hz and 1.8 p.u., respectively, to avoid instantaneous tripping. It is recommended the supplier of the TMEIC photovoltaic inverter model examine this model for three-phase faults that cause the model to trip on over frequency and over voltage protection.

For GEN-2016-002, the Gamesa User Model (GD0800_V32.lib) exhibited errors in the stability analysis. It was observed that other interconnection projects utilized the Gamesa GXX048 module (GXX048_v32.lib) which exhibited expected response to system disturbances. Therefore, the GXX048 module was used to replace the supplied GD0800 module.

After implementing the above upgrades, the contingency analysis was re-simulated for all contingencies. With the upgrades, the Stability Analysis determined that there was no wind turbine tripping or system instability observed as a result of interconnecting all study projects at 100% output.

SUMMARY OF THE SHORT CIRCUIT ANALYSIS

The short circuit analysis was performed on the 2017 Summer Peak and 2025 Summer Peak power flows for all study projects. Refer to Table ES-2 and Table ES-3 for a list of maximum fault currents observed for each study project for the 17SP and 25SP cases, respectively.

Table ES-2
2017SP: List of Maximum Fault Currents Observed for Each Study Project

Study Project	Fault Current at POI (kA)	Maximum Fault Current (kA)	Fault Location	Bus Voltage (kV)
GEN-2015-018	5.59	28.04	Tolk East/West	230 kV
GEN-2015-033	8.01	31.96	Cimaron	345 kV
GEN-2015-039	7.24	28.04	Tolk East/West	230 kV

[1]Lagging power factors are negative and leading power factors are positive

SUMMARY OF LOW WIND/IRRADIANCE ANALYSIS

The amount of reactive power injected into the transmission network was recorded at the point of interconnection for each wind and solar powered interconnection request for each season. The maximum reactance needed for zero Mvar flow was 12.7 Mvar for GEN-2016-062 (Andrews 230 kV). The minimum reactance needed for zero Mvar flow was 0.0 Mvar for ASGI-2016-001 (Wolfforth 115 kV) and ASGI-2016-004 (Palo Duro 115 kV).

SECTION 1: OBJECTIVES

The objective of this report is to provide Southwest Power Pool, Inc. (SPP) with the deliverables for the "DISIS-2016-001 (Group 06) Definitive Impact Study." SPP requested an Interconnection System Impact Study for sixteen (16) generation interconnections for 2016 Winter Peak, 2017 Summer Peak, 2020 Summer Peak, 2020 Winter Peak, and 2025 Summer Peak, which requires a Stability Analysis, Short Circuit Analysis, Power Factor Analysis, Low Wind/Irradiance Analysis, and an Impact Study Report.

SECTION 2: BACKGROUND

The Siemens Power Technologies International PSS/E power system simulation program Version 32.2.2 was used for this study. SPP provided the stability database cases for 2016 Winter Peak, 2017 Summer Peak, 2020 Summer Peak, 2020 Winter Peak, and 2025 Summer Peak conditions and a list of contingencies to be examined. The model includes the study projects shown in Table 2-1 and the previously queued projects listed in Table 2-2. Refer to Appendix A for the steady-state and dynamic model data for the study projects. A power flow one-line diagram for each generation interconnection project is shown in Figures 2-1 through 2-15. Note that the one-line diagrams represent the 2017 Summer Peak case.

The Stability Analysis determined the impacts of the new interconnecting projects on the stability and voltage recovery of the nearby system and the ability of the interconnecting projects to meet FERC Order 661A. If problems with stability or voltage recovery are identified, the need for reactive compensation or system upgrades were investigated. Three-phase faults and single line-to-ground faults were examined as listed in Table 2-3. Note that all contingencies listed were examined for the cluster scenario, and specified contingencies (indicated by an X) were examined for each Stand Alone generator.

A Short Circuit Analysis was performed on the 2017 Summer Peak and 2025 Summer Peak study years for each study generator. The study was performed five buses out from the study generator's point of interconnection and results were documented.

The Power Factor Analysis determined the power factor at the point of interconnection for the wind or solar interconnection projects for pre-contingency and post-contingency conditions. Table 2-3 lists the contingencies developed from the three-phase fault definitions provided in the group's interconnection impact study request.

The Low Wind/Irradiance Analysis was completed for all wind farm and solar farm interconnections. This analysis determined if reactive support was needed to have an Mvar flow of approximately zero at the point of interconnection (POI).

Table 2-1
Interconnection Projects Evaluated

Request	Size (MW)	Generator Model	Point of Interconnection
GEN-2015-018	80.0	GE 2.0MW (wind; 584603)	Tap on Curry County (524822) to Bailey County (525028) 115kV (G15-018T, 560032)
GEN-2015-033	151.8	Vestas V112 3.45 MW (wind; 584763)	Tap on Tuco (525832) – OKU (511456) 345kV (G14-074-TAP, 560027)

SECTION 3: STABILITY ANALYSIS

The objective of the Stability Analysis was to determine the impacts of the generator interconnections on the stability and voltage recovery on the SPP transmission system. If problems with stability or voltage recovery were identified, the need for reactive compensation or system upgrades was investigated.

3.1 Approach

SPP provided MEPPI with the following five power flow cases:

- MDWG15-16WP_DIS1601_G06
- MDWG15-17SP_DIS1601_G06
- MDWG15-20SP_DIS1601_G06
- MDWG15-20WP_DIS1601_G06
- MDWG15-25SP_DIS1601_G06

Each case was examined prior to the Stability Analysis to ensure the case contained the proposed study projects and any previously queued projects listed in Tables 2-1 and 2-2 respectively. There was no suspect power flow data in the study area. The dynamic datasets were also verified and stable initial system conditions (i.e., "flat lines") were achieved. Three-phase and single phase-to-ground faults listed in Table 2-3 were examined. Single-phase fault impedances were calculated for each season to result in a voltage of approximately 60% of the pre-fault voltage. Refer to Table 3-1 for a list of the calculated single-phase fault impedances utilized.

Table 3-1
Calculated Single-Phase Fault Impedances

*Refer to Table 2-3 for a description of the contingency scenario

Bus voltages, machine rotor angles, and previously queued generation in the study area were monitored in addition to bus voltages and machine rotor angles in the following areas:

- 520 AEPW
- 524 OKGE
- 525 WFEC
- 526 SPS
- 531 MIDW
- 534 SUNC
- 536 WERE

Requested and previously queued generation outside the above study area was also monitored.

The results of the analysis determined if reactive compensation or system upgrades were required to obtain acceptable system performance. If additional reactive compensation was required, the size, type, and location were determined. The proposed reactive reinforcements would ensure the wind or solar farm meets FERC Order 661A low voltage requirements and return the wind or solar farm to its pre-disturbance operating voltage. If the results indicated the need for fast responding reactive support, dynamic support such as an SVC or STATCOM was investigated. If tripping of the prior queued projects was observed during the stability analysis (for under/over voltage or under/over frequency) the simulations were re-ran with the prior queued project's voltage and frequency tripping disabled.

3.2 Cluster Scenario Stability Analysis Results

The Stability Analysis determined that there were multiple contingencies across all seasons that resulted in system/voltage instability, generation tripping offline, and poor post-fault voltage recovery when all generation interconnection requests were at 100% output.

Refer to Table 3-2 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3. Table 3-2 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, 2020 Summer Peak, 2020 Winter Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline, if acceptable voltage recovery was observed after the fault was cleared, and if the voltage recovered to above 0.9 p.u. and below 1.1 p.u. post fault steady-state conditions. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady-state voltage (for N-1 contingencies) at the pre-contingent level or at least above 0.9 p.u. and below 1.1. p.u.

Refer to Appendix B, Appendix C, Appendix D, Appendix E, and Appendix F for a complete set of plots for all contingencies for 2016 Winter Peak, 2017 Summer Peak, 2020 Summer Peak, 2020 Winter Peak, and 2025 Summer Peak conditions, respectively.

Note 1: Gen Stab = Generator Instability

Note 2: Poor voltage damping

Note 3: Existing condition, not mitigated

To mitigate the system/voltage instability, voltage violations, generation tripping offline, and poor post-fault steady-state voltages, the following upgrades were provided by SPP and implemented (upgrades provided here are required for 16WP season and thus, implemented in remaining years):

- Crawfish Draw to Seminole 765 kV circuit #1
- Crawfish Draw 765/345 kV transformer 1 & 2
- Seminole 765/345 kV transformer 1 & 2
- Potter County to Grapevine to Chisholm 345 kV circuit #1
- Potter County to Tolk 345 kV circuit #1
- Tolk to Crawfish Draw 345 kV circuit #1
- OKU SVC +300/-100 Mvar (add +200 Mvar)
- Add 200 Mvar Capacitor Bank at OKU 345 kV (550 Mvar capacitor bank total)
- Chaves County – Price – CV Pine – Capitan 115 kV circuit #1
    - Required to be implemented in 16WP and 17SP
    - Line exists in 20WP, 20SP, and 25SP
- Grapevine to Beaver County 345 kV circuit #1
- Beaver County to Clark County 345 kV circuit #1
- Re-terminate the Yoakum to TUCO 345 kV line from TUCO to Crawfish Draw
- TUCO to Crawfish Draw 345 kV circuit #2
- Rio Blanco +300/-100 Mvar SVC

In the 16WP and 20WP seasons, under normal system dispatch, system instability exists for a fault at Crawfish Draw 765 kV that results in the loss of the Crawfish Draw to Seminole 765 kV line. For this reason, it is necessary to limit the flow along the Crawfish Draw to Seminole 765 kV line. The following flow limits are required for the 16WP and 20WP seasons, respectively:

- 16WP Flow Limit on Crawfish Draw to Seminole 765 kV: 1625 MW from Crawfish Draw 765 kV end
- 20WP Flow Limit on Crawfish Draw to Seminole 765 kV: 1395 MW from Crawfish Draw 765 kV end

Several violations exist only in the 20SP, 20WP, and 25SP seasons. Refer below for the additional mitigation required for these seasons (seasons listed in parenthesis for which mitigation is required):

- NA Enrich 115 kV capacitor bank: 28.8 Mvar (20WP, 20SP) (an existing cap bank)
- Drinkard 115 kV capacitor bank: 14.4 Mvar (20WP) (an existing cap bank)
- Additional Andrews to NA Enrich 115 kV circuit #2
- Seminole to Mustang 115 kV circuit #1 (25SP)
- Hereford 115 kV capacitor bank: 25 Mvar (25SP) (a new cap bank)

FLT20-3PH, a three-phase fault resulting in the loss of Rio Blanco to Tuco 345 kV, was observed to have voltages above 1.1 p.u. post fault steady-state, poor voltage damping, and generation tripping offline (due to high voltage protection settings). Refer to Figure 3-1 for a representative comparison plot of Oklaunion and Tuco area voltages for the 2016 Winter Peak case with and without system upgrades. Refer to Figure 3-2 for comparison plot of GEN-2014-074's and GEN-2015-033's real power for the 2016 Winter Peak case with and without system upgrades. After the upgrades as stated earlier were implemented, there was no additional voltage violations or generation tripping off-line. The system recovered within SPP criteria.

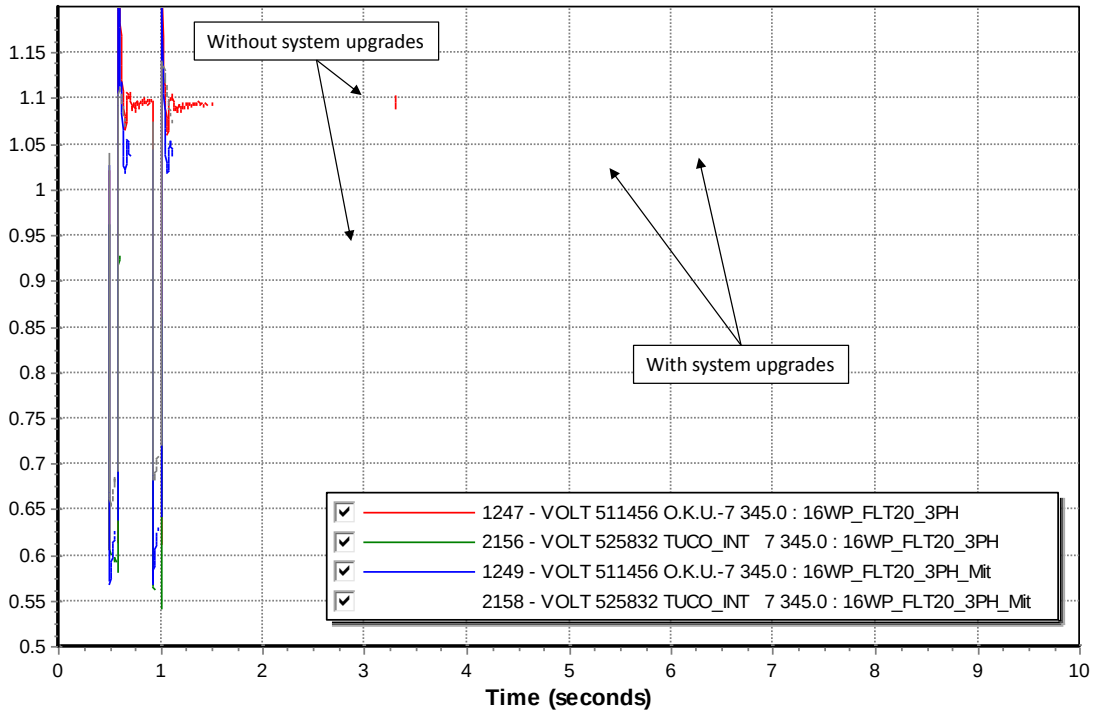

Figure 3-1: Representative plot of Oklaunion and Tuco area voltages for 2016 Winter Peak conditions with and without system upgrades for FLT20.

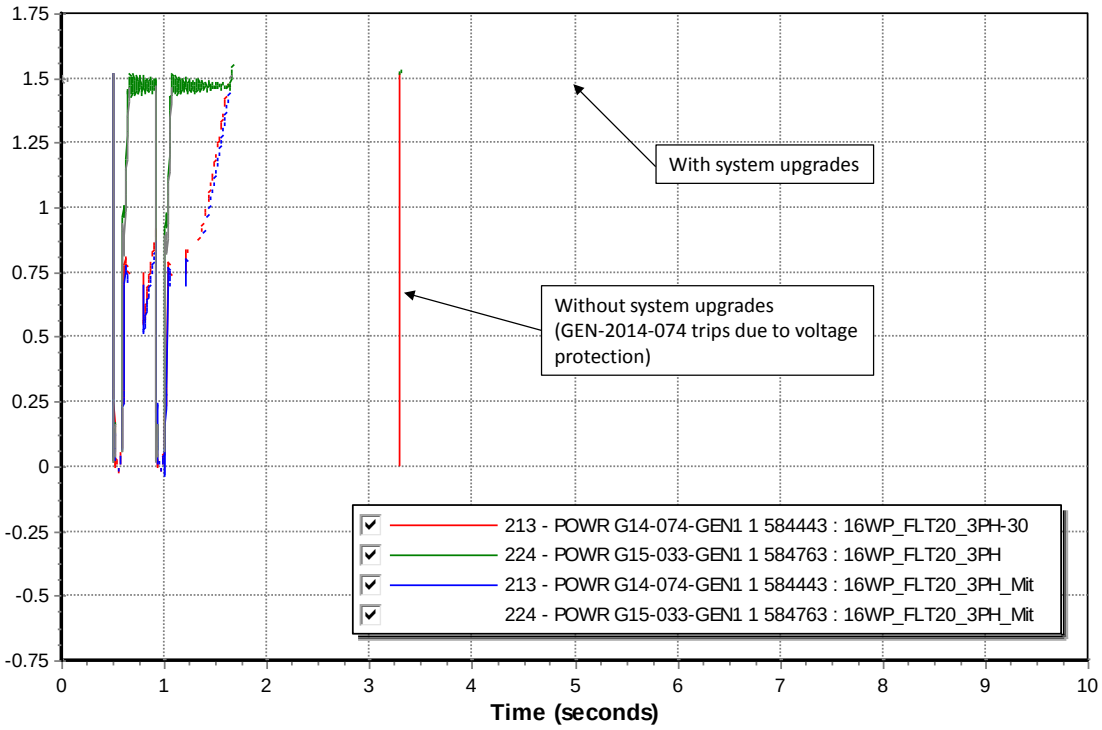

Figure 3-2: Comparison plot of GEN-2014-074's and GEN-2015-033's real power for 2016 Winter Peak conditions with and without system upgrades for FLT20.

FLT21-3PH, a three-phase fault resulting in the loss of Rio Blanco to OKU 345 kV, was observed to have system instability and generation tripping offline. Refer to Figure 3-3 for a representative comparison plot of Oklaunion and Tuco area voltages for the 2016 Winter Peak case with and without system upgrades. Refer to Figure 3-4 for comparison plot of GEN-2014-074's and GEN-2015-033's real power for the 2016 Winter Peak case with and without system upgrades. After the upgrades as stated earlier were implemented, there was no additional voltage violations or generation tripping off-line. The system recovered within SPP criteria.

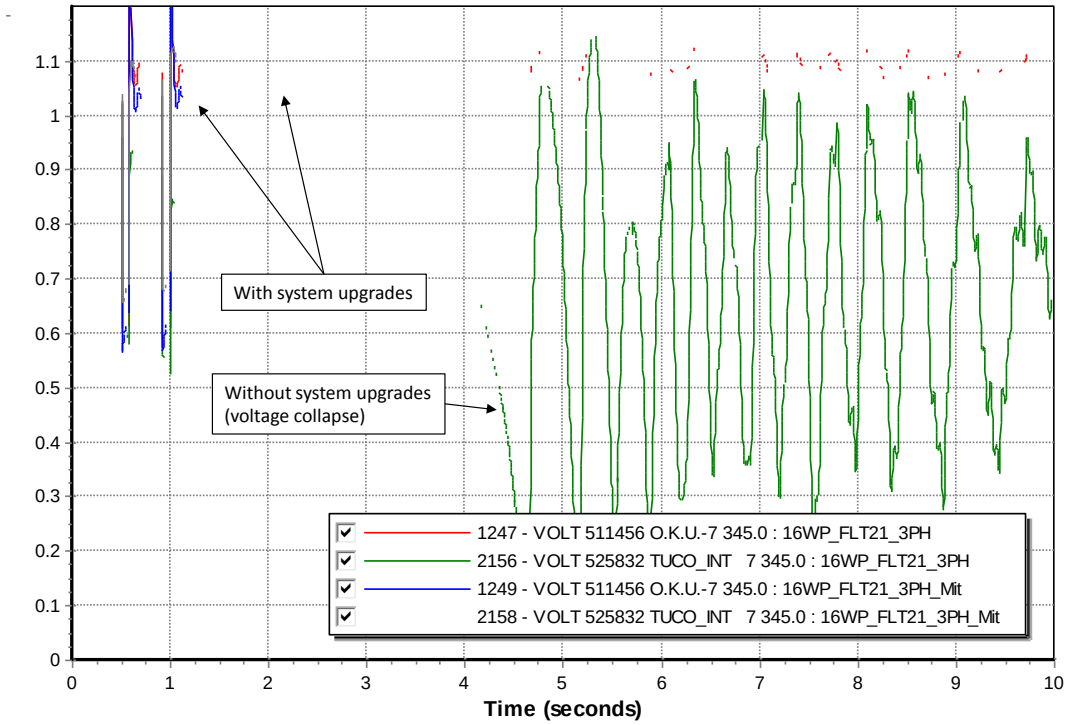

Figure 3-3: Representative plot of Oklaunion and Tuco area voltages for 2016 Winter Peak conditions with and without system upgrades for FLT21.

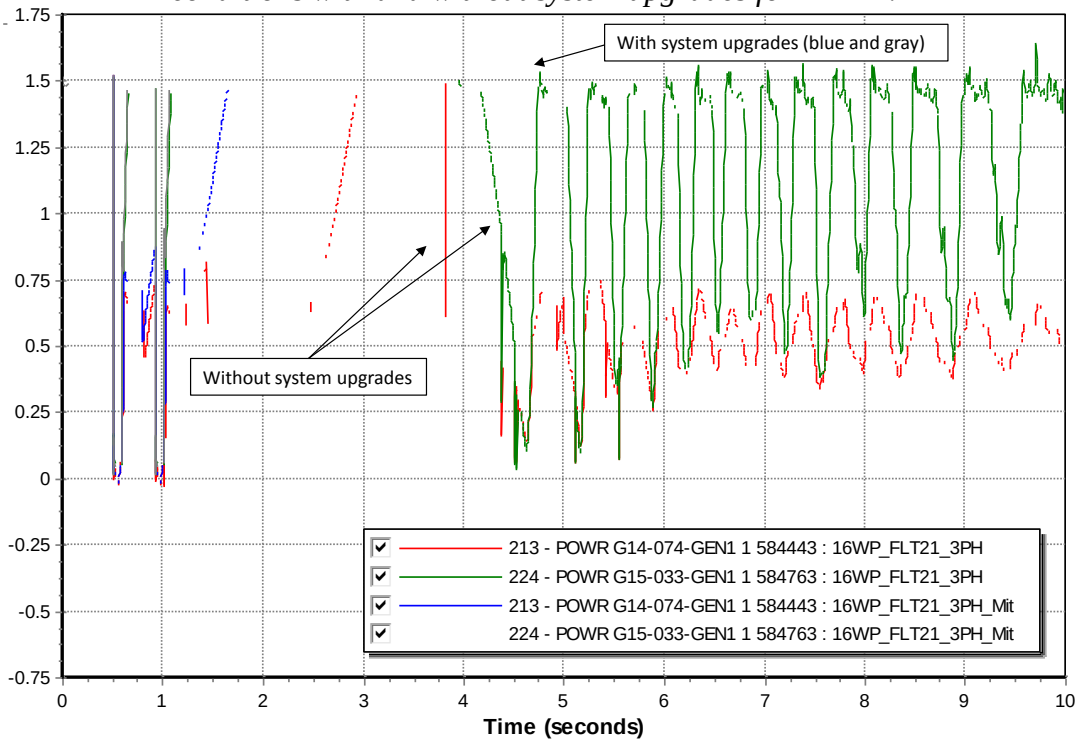

Figure 3-4: Comparison plot of GEN-2014-074's and GEN-2015-033's real power for 2016 Winter Peak conditions with and without system upgrades for FLT21.

FLT40-3PH, a three-phase fault resulting in the loss of Plant X to Newhart 230 kV, was observed to have system instability and generation tripping offline. Refer to Figure 3-5 for a representative comparison plot of Plant X and Newhart area voltages for the 2016 Winter Peak case with and without system upgrades. Refer to Figure 3-6 for comparison plot of GEN-2015-039's and GEN-2015-031's real power for the 2016 Winter Peak case with and without system upgrades. After the upgrades as stated earlier were implemented, there was no additional voltage violations or generation tripping off-line. The system recovered within SPP criteria.

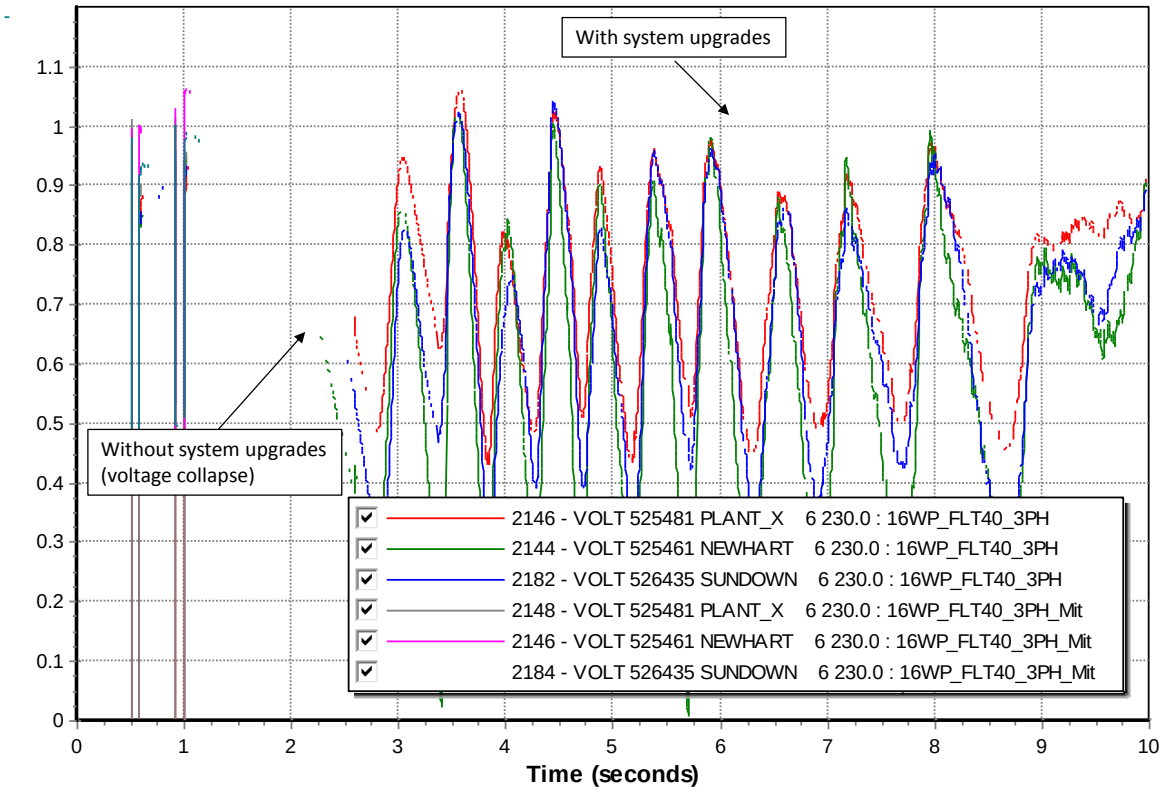

Figure 3-5: Representative plot of Plant X and Newhart area voltages for 2016 Winter Peak conditions with and without system upgrades for FLT40.

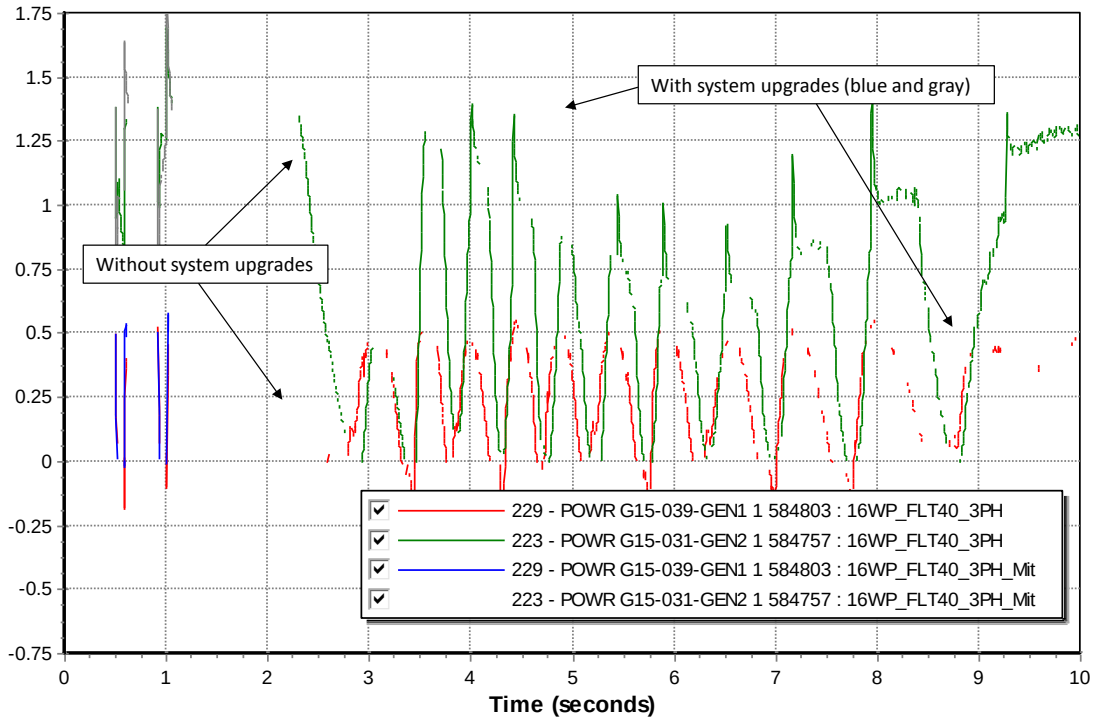

Figure 3-6: Comparison plot of GEN-2015-039's and GEN-2015-031's real power for 2016 Winter Peak conditions with and without system upgrades for FLT40.

FLT70-1PH, a single-phase stuck breaker fault resulting in the loss of Yoakum to Amoco-SS 230 kV, was observed to have voltage instability and generation tripping offline. Refer to Figure 3-7 for a representative comparison plot of Yoakum and Deaf Smith area voltages for the 2020 Winter Peak case with and without system upgrades. Refer to Figure 3-8 for comparison plot of GEN-2016-039's and GEN-2015-022's real power for the 2020 Winter Peak case with and without system upgrades. After the upgrades as stated earlier were implemented, there was no additional voltage violations or generation tripping off-line. The system recovered within SPP criteria.

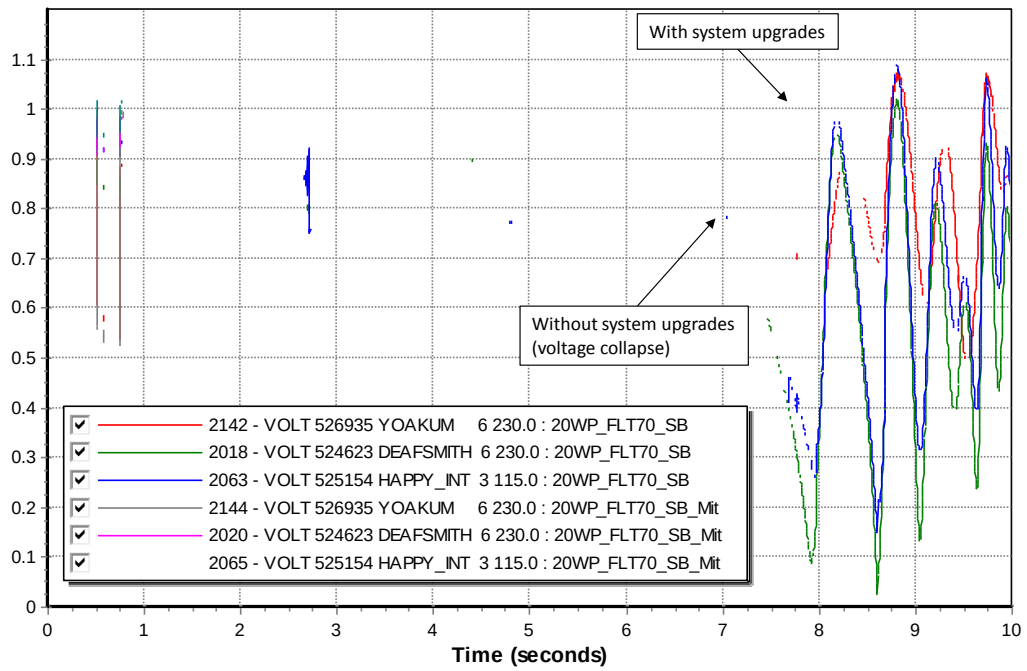

Figure 3-7: Representative plot of Yoakum and Deaf Smith area voltages for 2020 Winter Peak conditions with and without system upgrades for FLT70.

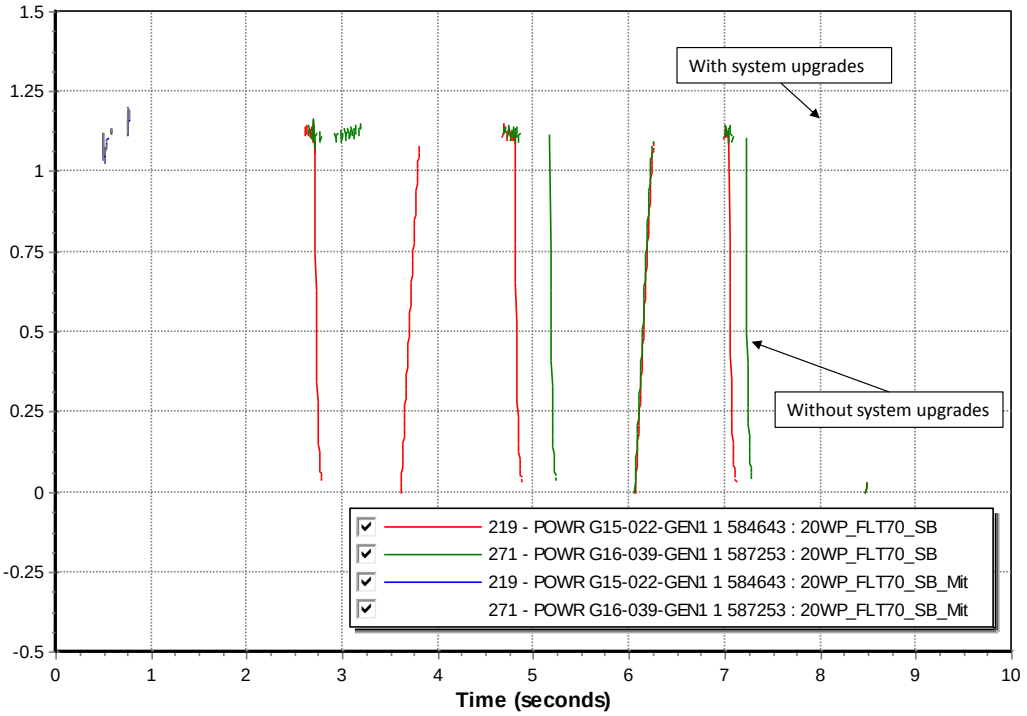

Figure 3-8: Comparison plot of GEN-2016-039's and GEN-2015-022's real power for 2020 Winter Peak conditions with and without system upgrades for FLT70.

FLT134-1PH, a single-phase stuck breaker fault resulting in the loss of Hobbs to Gaines Generation Tap 230 kV, was observed to have system instability and generator tripping. Refer to Figure 3-9 for a representative comparison plot of Hobbs area voltages for the 2020 Winter Peak case with and without system upgrades. Refer to Figure 3-10 for comparison plot of GEN-2016-015's and GEN-2016-062's real power for the 2020 Winter Peak case with and without system upgrades. The upgrades as stated in the beginning of this section were implemented. Additionally, the capacitor bank at NA Enrich 115 kV (28.8 Mvar) and Drinkard 115 kV (14.4 Mvar) were locked at full output. With the addition of these capacitor banks, there was no additional voltage violations or generation tripping off-line. The system recovered within SPP criteria. Note after discussion with SPP, it was determined a second circuit from Andrews to NEF 115 kV will be implemented which will help the voltage issue in this area.

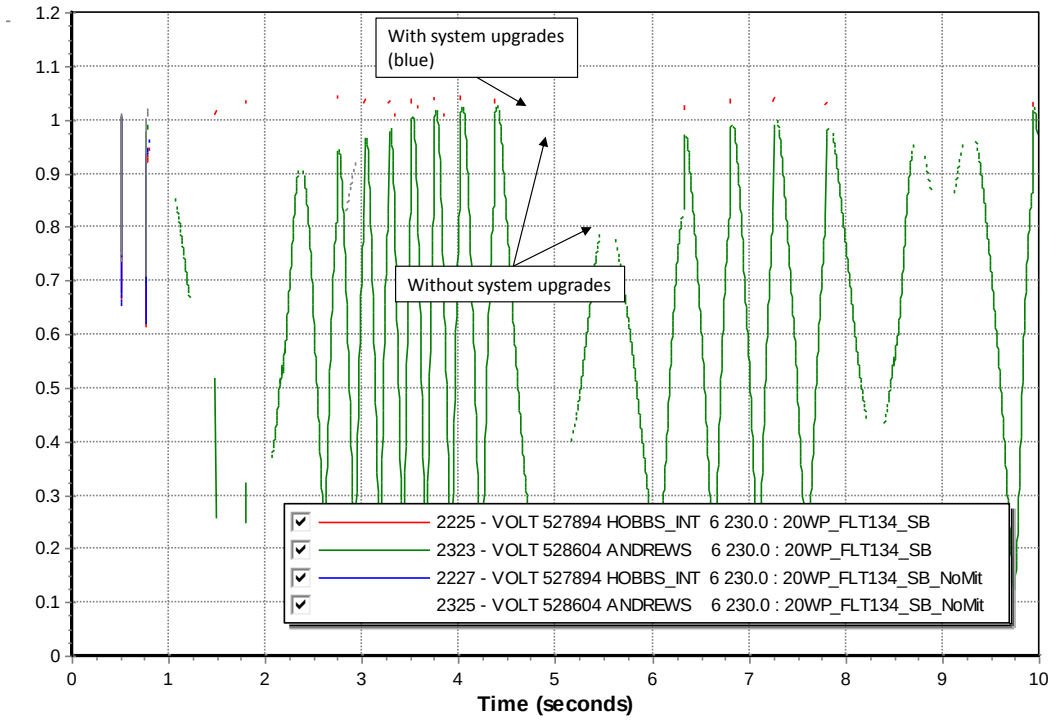

Figure 3-9: Representative plot of Andrews area voltages for 2020 Winter Peak conditions with and without system upgrades for FLT134.

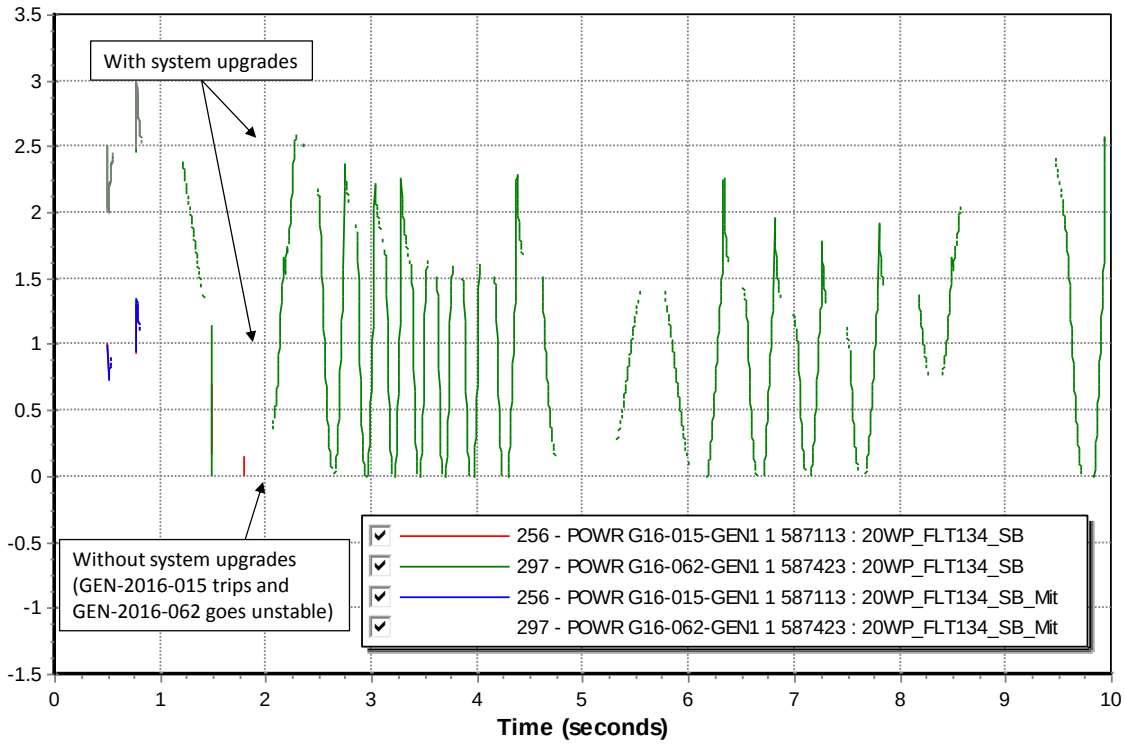

Figure 3-10: Comparison plot of GEN-2016-015's and GEN-2016-062's real power for 2020 Winter Peak conditions with and without system upgrades for FLT134.

FLT192-1PH, a single-phase stuck breaker fault resulting in the loss of Chaves County to Samson 115 kV and Chaves County to Urton 115 kV, was observed to have voltage recovery below 0.9 p.u. Refer to Figure 3-11 for a representative comparison plot of Chaves County area voltages for the 2016 Winter Peak case with and without system upgrades. After the upgrades as stated earlier were implemented, there was no additional voltage violations or generation tripping off-line. The system recovered within SPP criteria.

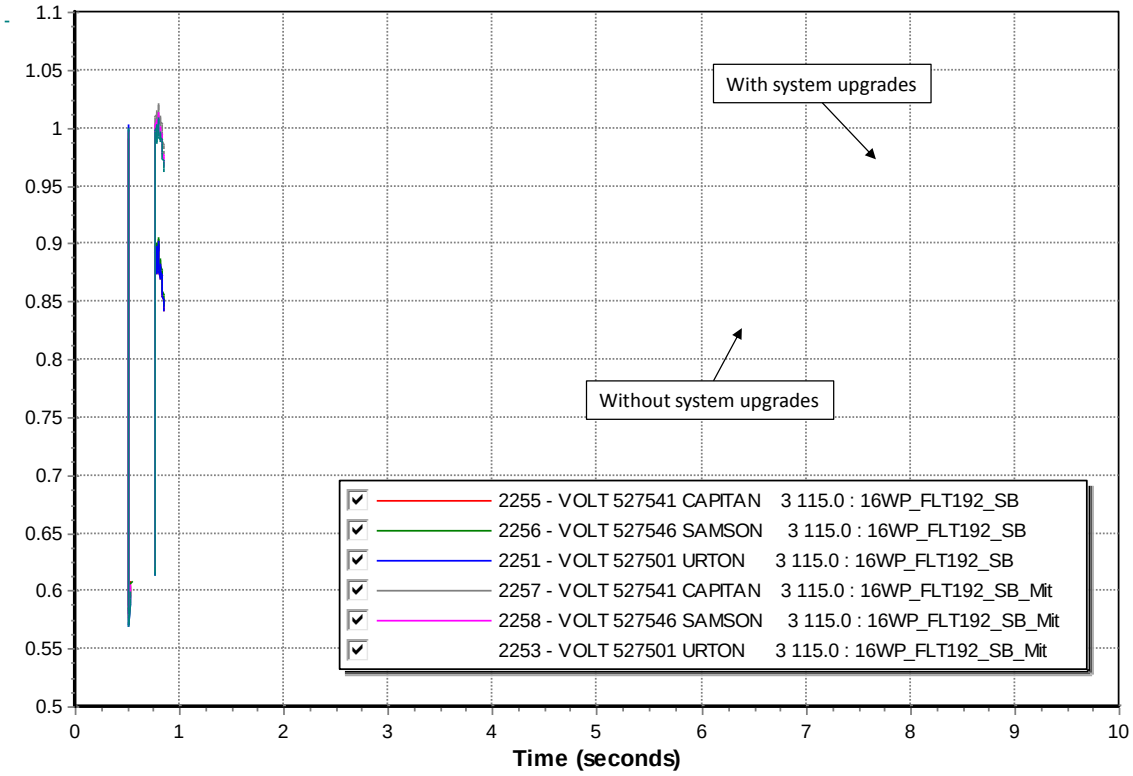

Figure 3-11: Representative plot of Chaves County area voltages for 2016 Winter Peak conditions with and without system upgrades for FLT192.

FLT196-3PH, a three-phase fault at Crawfish Draw 765 kV resulting in the loss of Crawfish Draw to Seminole 765 kV, was observed to have system instability. Refer to Figure 3-12 for a representative comparison plot of OKU 345 kV area voltages for the 2016 Winter Peak case with and without system upgrades. In addition to the upgrades as previously stated, it was necessary to limit the flow along the Crawfish Draw to Seminole 765 kV line in both the 2016 Winter Peak case and the 2020 Winter Peak case. The following are the flow limits along the Crawfish Draw to Seminole 765 kV line:

- 2016 Winter Peak: 1625 MW
- 2020 Winter Peak: 1395 MW

With the addition of these flow limits, there was no additional voltage violations or generation tripping off-line. The system recovered within SPP criteria.

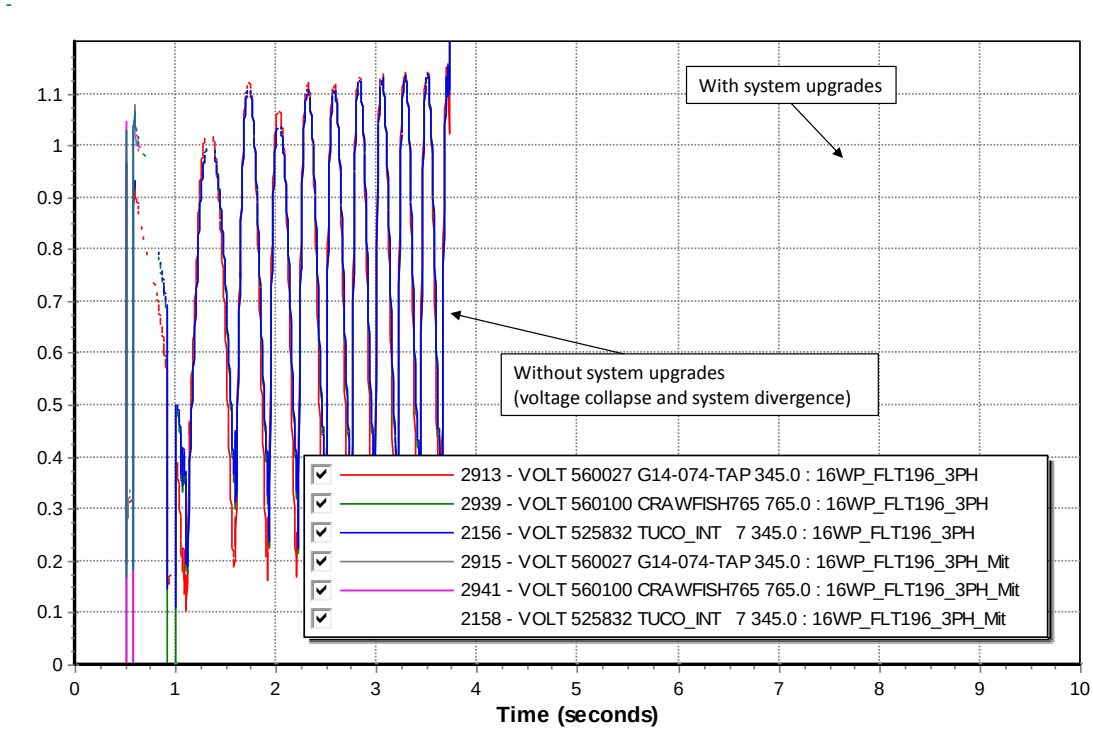

Figure 3-12: Representative plot of OKU 345 kV area voltages for 2016 Winter Peak conditions with and without system upgrades for FLT196.

For the 25SP case, low voltages were observed in the Seminole and Mustang 230 kV area for faults resulting in the loss of Seminole to Mustang 230 kV. With the addition of the Seminole to Mustang 115 kV circuit #1, these low voltage were mitigated. Refer to Figure 3-13 for a representative comparison plot of bus voltages in the Seminole 230 kV area for FLT56-3PH (three-phase fault resulting in loss of Seminole to Mustang 230 kV circuit #1) with and without system upgrades.

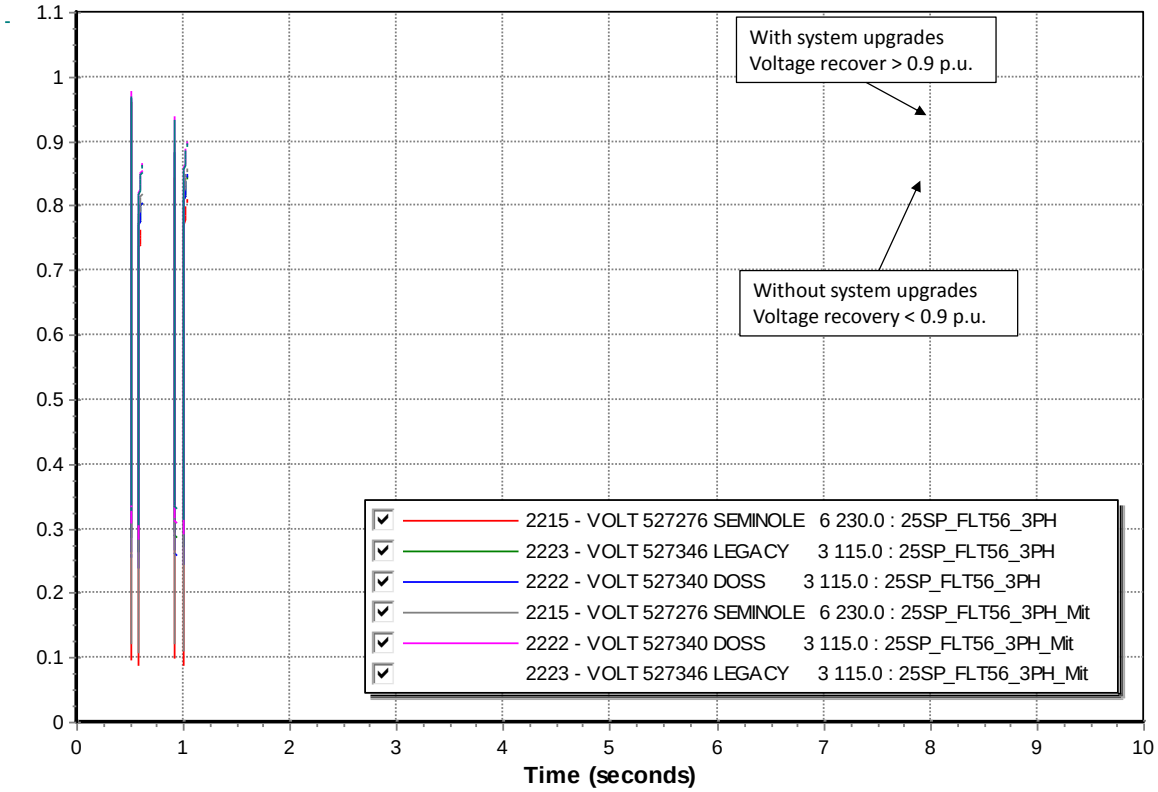

Figure 3-13: Representative plot of Seminole area voltages for 2025 Summer Peak conditions with and without system upgrades for FLT56.

For faults FLT104 through FLT116, which are three-phase faults involving GEN-2016-002, GEN-2016-002 trips offline due to modeling issues with the supplied Gamesa User Model (GD0800_V32.lib). For this study, another version of the Gamesa User Model that has been utilized previously with expected recovery characteristics was implemented. The GXX048 Gamesa User Model (GXX048_V32.lib) was utilized for this study and was observed to behave correctly. It is recommended the GD0800 Gamesa User Model be investigated before implementing in the DISIS-2016-001 Group 6 study.

For faults FLT126 through FLT139, which are three-phase faults near Hobbs 230 kV and adjacent buses, GEN-2016-015 trips offline due to over frequency and over voltage protection. For this study, the over frequency and over voltage protection of the TMEIC photovoltaic inverter model (ITMEIC) were set to 75 Hz and 1.8 p.u., respectively, to avoid instantaneous tripping. It is recommended the developer of the TMEIC photovoltaic inverter model examine this model for three-phase faults that cause the model to trip on over frequency and over voltage protection.

After the upgrades were implemented, the Stability Analysis was re-simulated to determine system stability. With the required upgrade, the Stability Analysis determined that there was no wind turbine tripping or system instability as a result of interconnected all study projects at 100% output.

3.3 Stand Alone Scenario Stability Analysis Results: GEN-2015-018

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions when GEN-2015-018 was interconnected at 100% output. Refer to Table 3-3 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2015-018 Stand Alone Analysis. Table 3-3 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u. Note the voltage at Bailey County 115 kV recovered below 0.9 p.u. for several faults at Bailey County 115 kV but these violations were determined to be pre-existing conditions and are not mitigated in this study.

Refer to Appendix G, Appendix H, and Appendix J for a complete set of plots for all Stand Alone Scenario contingencies for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions, respectively

Note 1: Pre-existing condition, not mitigated

3.4 Stand Alone Scenario Stability Analysis Results: GEN-2015-033

The Stand Alone Scenario Stability Analysis determined that there multiple contingencies across all seasons that resulted in system/voltage instability and generation tripping offline when GEN-2015-033 was interconnected at 100% output.

Refer to Table 3-4 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2015-033 Stand Alone Analysis. Table 3-4 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

It was determined that the following upgrades were required to mitigate the violations observed:

- Potter County to Grapevine to Chisholm 345 kV circuit #1
- Potter County to Tolk 345 kV circuit #1
- Tolk to Crawfish Draw 345 kV circuit #1
- OKU SVC +300/-100 Mvar (add +200 Mvar)
- Add 200 Mvar Capacitor Bank at OKU 345 kV (550 Mvar capacitor bank total)

After the above upgrades were implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria.

Table 3-4
Stand Alone Scenario GEN-2015-033: Stability Analysis Summary of Results for 2016 Winter, 2017 Summer, and 2025 Summer Peak Conditions

3.5 Stand Alone Scenario Stability Analysis Results: GEN-2015-039

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2016 Winter Peak and 2017 Summer Peak when GEN-2015-039 was interconnected at 100% output. However, two contingencies resulted in low voltage recovery below 0.9 p.u. in the 2025 Summer Peak case.

Refer to Table 3-5 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2015-039 Stand Alone Analysis. Table 3-5 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

It was determined that the following upgrades were required to mitigate the 2025 Summer Peak violations observed:

- 25 Mvar capacitor bank at Hereford 115 kV

After the above upgrades were implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria.

3.6 Stand Alone Scenario Stability Analysis Results: GEN-2015-040

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2016 Winter Peak and 2017 Summer Peak when GEN-2015-040 was interconnected at 100% output. However, two contingencies resulted in low voltage recovery below 0.9 p.u. in the 2025 Summer Peak case.

Refer to Table 3-6 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2015-040 Stand Alone Analysis. Table 3-6 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

It was determined that the following upgrades were required to mitigate the 2025 Summer Peak violations observed:

- Seminole to Mustang 115 kV circuit #1

After the above upgrades were implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria.

3.7 Stand Alone Scenario Stability Analysis Results: GEN-2015-041

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2025 Summer Peak when GEN-2015-041 was interconnected at 100% output. However, several contingencies resulted in high voltages, system instability, and generator tripping in the 2016 Winter Peak Case and 2017 Summer Peak case.

Refer to Table 3-7 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2015-041 Stand Alone Analysis. Table 3-7 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

It was determined that the following upgrades were required to mitigate the 2025 Summer Peak violations observed:

- Potter County to Grapevine to Chisholm 345 kV circuit #1
- Potter County to Tolk 345 kV circuit #1
- Tolk to Crawfish Draw 345 kV circuit #1
- OKU SVC +300/-100 Mvar (add +200 Mvar)
- Add 200 Mvar Capacitor Bank at OKU 345 kV (550 Mvar capacitor bank total)

After the above upgrades were implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria.

Table 3-7

3.8 Stand Alone Scenario Stability Analysis Results: GEN-2015-078

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2016 Winter Peak and 2017 Summer Peak when GEN-2015-078 was interconnected at 100% output. However, one contingency resulted in low voltage recovery below 0.9 p.u. in the 2025 Summer Peak case.

Refer to Table 3-8 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2015-078 Stand Alone Analysis. Table 3-8 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

It was determined that the following upgrades were required to mitigate the 2025 Summer Peak violation observed:

- Seminole to Mustang 115 kV circuit #1

After the above upgrades were implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria.

3.9 Stand Alone Scenario Stability Analysis Results: ASGI-2016-001

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak when ASGI-2016-001 was interconnected at 100% output.

Refer to Table 3-9 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the ASGI-2016-001 Stand Alone Analysis. Table 3-9 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

3.10 Stand Alone Scenario Stability Analysis Results: ASGI-2016-002

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak when ASGI-2016-002 was interconnected at 100% output.

Refer to Table 3-10 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the ASGI-2016-002 Stand Alone Analysis. Table 3-10 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

3.11 Stand Alone Scenario Stability Analysis Results: GEN-2016-002

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak when GEN-2016-002 was interconnected at 100% output.

Refer to Table 3-11 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-002 Stand Alone Analysis. Table 3-11 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

For GEN-2016-002, GEN-2016-002 trips offline due to modeling issues with the supplied Gamesa User Model (GD0800_V32.lib). For this study, another version of the Gamesa User Model that has been utilized previously with expected recovery characteristics was implemented. The GXX048 Gamesa User Model (GXX048_V32.lib) was utilized for this study and was observed to behave correctly. It is recommended the GD0800 Gamesa User Model be investigated before implementing in the DISIS-2016-001 Group 6 study.

3.12 Stand Alone Scenario Stability Analysis Results: ASGI-2016-004

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak when ASGI-2016-004 was interconnected at 100% output.

Refer to Table 3-12 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the ASGI-2016-004 Stand Alone Analysis. Table 3-12 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

3.13 Stand Alone Scenario Stability Analysis Results: GEN-2016-015

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak when GEN-2016-015 was interconnected at 100% output.

Refer to Table 3-13 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-015 Stand Alone Analysis. Table 3-13 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

For faults FLT126 through FLT139, which are three-phase faults near Hobbs 230 kV and adjacent buses, GEN-2016-015 trips offline due to over frequency and over voltage protection. For this study, the over frequency and over voltage protection of the TMEIC photovoltaic inverter model (ITMEIC) were set to 75 Hz and 1.8 p.u., respectively, to avoid instantaneous tripping. It is recommended the developer of the TMEIC photovoltaic inverter model examine this model for three-phase faults that cause the model to trip on over frequency and over voltage protection.

3.14 Stand Alone Scenario Stability Analysis Results: GEN-2016-039

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak when GEN-2016-039 was interconnected at 100% output.

Refer to Table 3-14 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-039 Stand Alone Analysis. Table 3-14 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

3.15 Stand Alone Scenario Stability Analysis Results: GEN-2016-056

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak when GEN-2016-056 was interconnected at 100% output.

Refer to Table 3-15 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-056 Stand Alone Analysis. Table 3-15 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

3.16 Stand Alone Scenario Stability Analysis Results: GEN-2016-058

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2017 Summer Peak and 2025 Summer Peak when GEN-2016-058 was interconnected at 100% output. However, one contingency resulted in voltage stability in the 2016 Winter Peak case.

Refer to Table 3-16 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-058 Stand Alone Analysis. Table 3-16 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

It was determined that the following upgrades were required to mitigate the 2016 Winter Peak violations observed:

- Potter County to Grapevine to Chisholm 345 kV circuit #1
- Potter County to Tolk 345 kV circuit #1
- Tolk to Crawfish Draw 345 kV circuit #1
- OKU SVC +300/-100 Mvar (add +200 Mvar)
- Add 200 Mvar Capacitor Bank at OKU 345 kV (550 Mvar capacitor bank total)

After the above upgrades were implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria.

3.17 Stand Alone Scenario Stability Analysis Results: GEN-2016-062

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak when GEN-2016-062 was interconnected at 100% output.

Refer to Table 3-17 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-062 Stand Alone Analysis. Table 3-17 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

3.18 Stand Alone Scenario Stability Analysis Results: GEN-2016-069

The Stand Alone Scenario Stability Analysis determined that there were no contingencies that resulted in system instability, generation tripping offline, or voltage violations for 2025 Summer Peak when GEN-2016-069 was interconnected at 100% output. However, several contingencies resulted in low voltages in the 2016 Winter Peak and 2017 Summer Peak case.

Refer to Table 3-18 for a summary of the Stability Analysis results for the contingencies listed in Table 2-3 that corresponds to the GEN-2016-069 Stand Alone Analysis. Table 3-18 is a summary of the stability results for the 2016 Winter Peak, 2017 Summer Peak, and 2025 Summer Peak conditions and states whether the system remained stable or generation tripped offline and if acceptable voltage recovery was observed after the fault was cleared. Voltage recovery criteria includes ensuring that the transient voltage recovery is between 0.7 p.u. and 1.2 p.u. and ending in a steady state voltage (for N-1 contingencies) at the pre-contingent level or at least 0.9 p.u.

It was determined that the following upgrades were required to mitigate the 2016 Winter Peak and 2017 Summer Peak violations observed:

- Potter County to Grapevine to Chisholm 345 kV circuit #1
- Potter County to Tolk 345 kV circuit #1
- Tolk to Crawfish Draw 345 kV circuit #1
- Chaves County – Price – CV Pine – Capitan 115 kV circuit #1
    - Required to be implemented in 16WP and 17SP
    - Line exists in 25SP

After the above upgrades were implemented, there were no additional voltage violations or system instability and all voltages and generators recovered within SPP criteria.

Table 3-18
Stand Alone Scenario GEN-2016-069: Stability Analysis Summary of Results for 2016 Winter, 2017 Summer, and 2025 Summer Peak Conditions

SECTION 4: SHORT CIRCUIT ANALYSIS

The objective of this task is to quantify the three-phase to ground fault currents for the 2017 Summer Peak and 2025 Summer Peak seasons for each interconnecting generator.

4.1 Approach

The short-circuit analysis will assess breaker adequacy and fault duties for the generator interconnection bus and five buses away from the point of interconnection. MEPPI will assume no outages to find maximum short-circuit currents that flow through the breaker. The Automatic Sequencing Fault Calculation (ASCC) function in PSS/E was utilized to perform this task. FLAT conditions were applied to pre-fault conditions and the following adjustments were utilized:

- All synchronous and asynchronous machine P and Q output was set to zero
- All transformer tap ratios were set to 1.0 p.u. and all phase shift angles were set to zero
- All generator reactance's were fixed to the subtransient reactance
- All line charging was set to zero
- All shunts were set to zero
- All loads were set to zero
- All pre-fault bus voltages were set to 1.0 p.u. and a phase shift angle of zero

Note upgrades found to be necessary for the Stability Analysis were included in the Short-Circuit Analysis.

4.2 Short Circuit Results: 2017 Summer Peak

The maximum fault current for each bus is provided for the 2017 Summer Peak conditions. The following tables show the short circuit results for the study generators for the 2017 Summer Peak condition:

- Table 4-1: Short Circuit Analysis for GEN-2015-018 (17SP)

4.3 Short Circuit Results: 2025 Summer Peak

The maximum fault current for each bus is provided for the 2025 Summer Peak conditions. The following tables show the short circuit results for the study generators for the 2025 Summer Peak conditions:

- Table 4-16: Short Circuit Analysis for GEN-2015-018 (25SP)
- Table 4-17: Short Circuit Analysis for GEN-2015-033 (25SP)
- Table 4-18: Short Circuit Analysis for GEN-2015-039 (25SP)
- Table 4-19: Short Circuit Analysis for GEN-2015-040 (25SP)
- Table 4-20: Short Circuit Analysis for GEN-2015-041 (25SP)
- Table 4-21: Short Circuit Analysis for GEN-2015-078 (25SP)
- Table 4-22: Short Circuit Analysis for ASGI-2016-001 (25SP)
- Table 4-23: Short Circuit Analysis for ASGI-2016-002 (25SP)
- Table 4-24: Short Circuit Analysis for GEN-2016-002 (25SP)
- Table 4-25: Short Circuit Analysis for ASGI-2016-004 (25SP)
- Table 4-26: Short Circuit Analysis for GEN-2016-015 and GEN-2016-062 (25SP)
- Table 4-27: Short Circuit Analysis for GEN-2016-039 (25SP)
- Table 4-28: Short Circuit Analysis for GEN-2016-056 (25SP)
- Table 4-29: Short Circuit Analysis for GEN-2016-058 (25SP)
- Table 4-30: Short Circuit Analysis for GEN-2016-069 (25SP)
