Generator Interconnection Studies

1 Revision History

Date	Author	Change Description
10/31/2016	SPP	Report Issued (FCS-2016-003).

2 Executive Summary

Generator Interconnection customers have requested a Feasibility Study under the Generator Interconnection Procedures (GIP) in the Southwest Power Pool Open Access Transmission Tariff (OATT). The Interconnection Customers' requests have been clustered together for the following Feasibility Cluster Study (FCS) window which closed June 30, 2016. This Feasibility Cluster Study analyzes generation interconnection requests totaling approximately 1,226 MW which would be interconnected with the transmission systems of Nebraska Public Power District (NPPD), Basin Electric Power Cooperative (BEPC), Southwestern Public Service Company (SPS), and Tri-State Generation & Transmission (TSGT). The generation interconnection requests have various proposed in-service dates¹. The generation interconnection requests included in this Feasibility Cluster Study are listed in Appendix A by queue number, amount, requested interconnection service, area, requested interconnection point, proposed interconnection point, and the requested in-service date.

Power flow analysis has indicated that for the power flow cases studied, 1,226 MW of nameplate generation may be interconnected with transmission system reinforcements within the SPP transmission system. The need for reactive compensation in accordance with Order No. 661-A for wind farm interconnection requests will be evaluated in the Preliminary Interconnection System Impact Study (PISIS) and Definitive Interconnection System Impact Study (DISIS) based on the wind turbine manufacturer and type requested by the Customer. Dynamic stability studies performed as part of the PISIS and DISIS Cluster Studies will provide additional guidance as to whether required reactive compensation can be static or a portion must be dynamic (such as a SVC).

Within the study scope of the Feasibility Cluster Studies, two (2) Points of Interconnection (primary or secondary POI) assumption analyses were conducted for GEN-2016-074, GEN-2016-076, GEN-2016-079, GEN-2016-085, and GEN-2016-086.

Twelve (12) scenario assumption analyses were conducted for the current study to account for GEN-2016-074, GEN-2016-076, GEN-2016-085, and GEN-2016-086 primary and secondary POIs. **Table 1** displays the Twelve (12) Energy Resource Interconnection Service (ERIS) and Network Resources Interconnection Service (NRIS) analyses that were performed. Interconnection Requests dispatching is explained in further detail in the Model Development Section.

¹ The generation interconnection requests in-service dates will need to be deferred based on the required lead time for the Network Upgrades necessary. The Interconnection Customers that proceed to the Facilities Study will be provided a new in-service date based on the competition of the Facilities Study.

In no way does this study guarantee operation for all periods of time. This interconnection study identifies and assigns transmission reinforcements for Energy Resource Interconnection Service (ERIS) interconnection injection constraints and Network Resource Interconnection Service (NRIS) constraints if requested by the Customer. This interconnection study does not assign transmission reinforcements for all potential transmission constraints. It should be noted that although this study analyzed many of the most probable contingencies, it is not an all-inclusive list and cannot account for every operational situation. Because of this, it is likely that the Customer(s) may be required to reduce their generation output to 0 MW, also known as curtailment, under certain system conditions to allow system operators to maintain the reliability of the transmission network.

The total estimated minimum cost assigned to Interconnection Customers for each interconnecting scenario is estimate in the following table and is also shown in Appendix E and F.

Table 2: Total Estimated Minimum Cost

Scenario Number	Total Estimated Minimum Cost
Scenario #1	\$153,600,000
Scenario #2	\$143,600,000
Scenario #3	\$143,100,000
Scenario #4	\$153,100,000
Scenario #5	\$79,000,000
Scenario #6	\$66,000,000
Scenario #7	\$68,250,000
Scenario #8	\$79,000,000
Scenario #9	\$118,000,000
Scenario #10	\$119,000,000
Scenario #11	\$105,000,000
Scenario #12	\$81,000,000

This total cost estimate is contingent upon higher queued customers paying for certain required Network Upgrades. Additionally, the total cost estimates are contingent on potential DISIS-2016-001 identified upgrades.

The one-line diagrams in Appendix D should be consulted for details of the alternate POIs. These costs do not include the Interconnection Customer Interconnection Facilities as defined by the SPP Open Access Transmission Tariff (OATT). This cost does not include the possible need for reactive compensation or additional interconnection facilities or network upgrades that may be identified through additional analyses performed in the PISIS and DISIS.

The power flow results listed in this report were obtained by analyzing the 1,226 MW of Feasibility Study Interconnection Requests in addition to prior queued Interconnection Requests up to and including DISIS-2016-001. DISIS-2016-001 study is not completed yet; however DISIS-2016-001 Interconnection Requests could be cost assigned potential Network Upgrades identified in this feasibility study analysis as non-incremental constraints as a result of FCS-2016-003 Interconnection Service addition. Those DC analysis constraints can be found in the Contingency Upgrade section. Please note DISIS-2016-001 AC contingency analysis has not been conducted and could result in additional upgrades and/or constraints. If any Interconnection Requests are withdrawn from the higher queued studies including DISIS-2016-001, then potential upgrades tentatively assigned to those Interconnection Requests may be assigned to the Interconnection Requests in this FCS-2016-003 study once these Interconnection Requests execute a Definitive Interconnection System Impact Study Agreement.

Network Constraints listed in Appendix H are located in the local area of the new generation when this generation is injected throughout the SPP footprint for the Energy Resource Interconnection Service (ERIS) Interconnection Request. Certain interconnection requests have been studied for Network Resource Interconnection Service (NRIS). Those constraints are also listed in Appendix H.

Additional Network constraints will have to be verified with a Transmission Service Request (TSR) and associated studies. With a defined source and sink in a TSR, this list of Network Constraints will be refined and expanded to account for all Network Upgrade requirements.

The required interconnection costs listed in Appendix E and F do not include all costs associated with the deliverability of the energy to final customers. These costs are determined by separate studies if the Customer submits a Transmission Service Request through SPP's Open Access Same Time Information System (OASIS) as required by Attachment Z1 of the SPP OATT.

1 Introduction

Generator Interconnection customers have requested a Feasibility Study under the Generator Interconnection Procedures (GIP) in the Southwest Power Pool Open Access Transmission Tariff (OATT). The Interconnection Customers' requests have been clustered together for the following Feasibility Cluster Study (FCS) window which closed June 20, 2016. This Feasibility Cluster Study analyzes generation interconnection requests totaling approximately 1,226 MW which would be interconnected with the transmission systems of Nebraska Public Power District (NPPD), Basin Electric Power Cooperative (BEPC), Southwestern Public Service Company (SPS), and Tri-State Generation & Transmission (TSGT). The generation interconnection requests have various proposed in-service dates². The generation interconnection requests included in this Feasibility Cluster Study are listed in Appendix A by queue number, amount, area, requested interconnection service, requested interconnection point, proposed interconnection point, and the requested in-service date.

Within the study scope of the Feasibility Cluster Studies, two (2) Points of Interconnection (primary or secondary POI) assumption analyses were conducted for GEN-2016-074, GEN-2016-076, GEN-2016-079, GEN-2016-085, and GEN-2016-086.

Twelve (12) scenario assumption analyses were conducted for the current study to account for GEN-2016-074, GEN-2016-076, GEN-2016-085, and GEN-2016-086 primary and secondary POIs. **Table 1** displays the Twelve (12) Energy Resource Interconnection Service (ERIS) and Network Resources Interconnection Service (NRIS) analyses that were performed.

The primary objective of this Feasibility Cluster Study is to identify the system constraints associated with connecting the generation to the area transmission system. The Feasibility and other subsequent Interconnection Studies are designed to identify attachment facilities, Network Upgrades and other Direct Assignment Facilities needed to accept power into the grid at each specific interconnection receipt point.

² The generator interconnection requests in-service dates will need to be deferred based on the required lead time for the Network Upgrades necessary. The Interconnection Customer's that proceed to the Facility Study will be provided a new in-service date based on the competition of the Facility Study.

2 Model Development (Study Assumptions)

2.1.1 Interconnection Requests Included in the Cluster

SPP has included all interconnection requests that submitted a Feasibility Study Agreement no later than June 30th, 2016 and were subsequently accepted by Southwest Power Pool under the terms of the Generator Interconnection Procedures (GIP) effective at the time of this study. The Interconnection Request(s) that are included in this study are listed in Appendix A.

2.1.2 Previously Queued Interconnection Requests

The previously queued Interconnection Requests included in this study are listed in Appendix B. In addition to the Base Case Upgrades, the previously queued requests and associated upgrades were assumed to be in-service and added to the Base Case models. These projects were dispatched as Energy Resources Interconnection Service (ERIS) and/or Network Resources Interconnection Service (NRIS) (in accordance with the individual Generator Interconnection Requests) with equal distribution across the SPP footprint.

2.2 Development of Base Cases

2.2.1 Power Flow

The 2015 model series Integrated Transmission Planning Near-Term models (used in the 2016 ITPNT) including the 2016 Winter Peak (16WP), 2017 Spring (17G), 2017 Summer Peak (17SP), 2020 Light Load, Summer and Winter peak (20L, 20SP, 20WP), and 2025 Summer Peak (25SP) scenario 0 cases were used for this study. After the cases were developed, each of the control areas' resources were then re-dispatched to account for the new generation requests using current dispatch orders.

2.2.2 Dynamic Stability

Dynamic stability studies performed as part of the PISIS and DISIS Cluster Studies will provide additional guidance as to whether required reactive compensation can be static or a portion must be dynamic (such as a SVC).

2.2.3 Short Circuit

Short circuit analysis is performed as part of the PISIS and DISIS Cluster Studies will provide additional guidance as to whether required reactive compensation can be static or a portion must be dynamic (such as a SVC).

2.2.4 Base Case Upgrades

The following facilities are part of the SPP Transmission Expansion Plan or the Balanced Portfolio or recently approved Priority Projects. These facilities, have an approved Notice to Construct (NTC), or are in construction stages and were assumed to be in-service at the time of dispatch and added to the base case models. The FCS-2016-003 Interconnection Customers have not been assigned cost for the below listed projects. The FCS-2016-003 Interconnection Customers Generation Facilities in-

service dates may need to be delayed until the completion of the following upgrades. If for some reason, construction on these projects is discontinued, additional restudies will be needed to determine the interconnection needs of the Feasibility Study Interconnection Customers.

2.2.5 Contingent Upgrades

The following facilities do not yet have approval. These facilities have been assigned to higher queued Interconnection Customers. These facilities have been included in the models for the FCS-2016-003 study and are assumed to be in service. This list may not be all inclusive. The FCS-2016-003 Interconnection Customers at this time do not have responsibility for these facilities but may later be assigned the cost of these facilities if higher queued customers terminate their GIA or withdraw from the interconnection queue. The FCS-2016-003 Interconnection Customer Generation Facilities in-service dates may need to be delayed until the completion of the following upgrade(s).

- Upgrades assigned to DISIS-2010-002 Interconnection Customers:
 - Twin Church – Dixon County 230 kV circuit #1, rerate (320 MVA)
 - Buckner – Spearville 345 kV, terminal equipment
- Upgrades assigned to DISIS-2011-001 Interconnection Customers:
 - Hoskins – Dixon County – Twin Church 230 kV circuit #1, conductor clearance increase
 - (NRIS only) Woodward District EHV Phase Shifting Transformer
- Upgrades assigned to DISIS-2012-002 Interconnection Customers:
 - Lake Creek – Lone Wolf 69 kV circuit #1, reset CT
- Upgrades assigned to DISIS-2013-002 Interconnection Customers:

- Upgrades assigned to DISIS-2016-001 Interconnection Customers:
 - DISIS-2016-001 constraints were identified and network upgrades required for mitigation of constraints will be included in the DISIS-2016-001 study posting report
 - Constraints with potential FCS-2016-01 impact include:

2.2.5.1 Contingent DISIS-2016-001 Upgrades

The following facilities do not yet have approval but are identified as requiring non-incremental mitigations by the addition of the FCS-2016-003 addition. Mitigation for these facilities can potentially be assigned to DISIS-2016-001 Interconnection Customers. These facilities upgrades were considered for the FCS-2016-003 study and are assumed to be in service. This list may not be all inclusive. The FCS-2016-003 Interconnection Customers at this time do not have responsibility for these facilities but may later be assigned the cost of these facilities if higher queued customers terminate their GIA or withdraw from the interconnection queue. The FCS-2016-003 Interconnection Customer Generation Facilities in-service dates may need to be delayed until the completion of the following upgrade(s) required for mitigation of constraints listed in Tables 3, 4, 29, 30.

2.2.6 Potential Upgrades Not in the Base Cases

Any potential upgrade(s) that do not have a Notification to Construct (NTC) have not been included in the base case(s). These upgrade(s) include any identified in the SPP Extra-High Voltage (EHV) overlay plan, or any other SPP planning study other than the upgrades listed above in the previous section.

2.2.7 Regional Groupings

The Interconnection Request(s) listed in Appendix A are grouped together into six (6) active regional groups based on geographical and electrical impacts. These groupings are shown in Appendix C.

2.3 Development of Analysis Cases

2.3.1 Power Flow

For Variable Energy Resources (VER) (solar/wind) in each power flow case, Energy Resource Interconnection Service (ERIS), is evaluated for the generating plants within a geographical area of the interconnection request(s) for the VERs dispatched at 100% nameplate of maximum generation. The VERs in the remote areas are dispatched at 20% nameplate of maximum generation. These projects are dispatched across the SPP footprint using load factor ratios.

Peaking units are not dispatched in the 2017 spring, or in the “High VER” summer and winter peaks. To study peaking units’ impacts, the 2016 winter peak, 2017 summer peak, 2020 summer and winter peaks, and 2025 summer peak models are developed with peaking units dispatched at 100%

of the nameplate rating and VERs dispatched at 20% of the nameplate rating. Each interconnection request is also modeled separately at 100% nameplate for certain analyses.

All generators (VER and peaking) that requested Network Resource Interconnection Service (NRIS) are dispatched in an additional analysis into the interconnecting Transmission Owner's (T.O.) area at 100% nameplate with Energy Resource Interconnection Service (ERIS) only requests at 80% nameplate. This method allows for identification of network constraints that are common between regional groupings to have affecting requests share the mitigating upgrade costs throughout the cluster.

2.3.2 Dynamic Stability

Dynamic stability studies performed as part of the PISIS and DISIS Cluster Studies will provide additional guidance as to whether required reactive compensation can be static or a portion must be dynamic (such as a SVC).

2.3.3 Short Circuit

Short circuit analysis is performed as part of the PISIS and DISIS Cluster Studies will provide additional guidance as to whether required reactive compensation can be static or a portion must be dynamic (such as a SVC).

3 Identification of Network Constraints

3.1.1 Thermal Overloads

Network constraints are found by using PSS/E MUST First Contingency Incremental Transfer Capability (FCITC) analysis on the entire cluster grouping dispatched at the various levels previously mentioned.

For Energy Resource Interconnection Service (ERIS), thermal overloads are determined for system intact (n-0) (greater than 100% of Rate A - normal) and for contingency (n-1) (greater than 100% of Rate B – emergency) conditions.

The overloads are then screened to determine which of generator interconnection requests have at least

- 3% Distribution Factor (DF) for system intact conditions (n-0),
- 20% DF upon outage based conditions (n-1),
- or 3% DF on contingent elements that resulted in a non-converged solution.

Appropriate transmission support is then determined to mitigate the constraints.

Interconnection Requests that requested Network Resource Interconnection Service (NRIS) are also studied in a separate NRIS analysis to determine if any constraint measured greater than or equal to a 3% DF. If so, these constraints are also considered for transmission reinforcement under NRIS.

3.1.2 Voltage

Steady State Voltage analysis is performed as part of the PISIS and DISIS Cluster Studies will provide additional guidance as to whether required reactive compensation. Monitored facilities and transmission reinforcement criteria for this analysis will be provided during the PISIS and/or DISIS report

3.1.3 Dynamic Stability

Dynamic stability studies performed as part of the PISIS and DISIS Cluster Studies will provide additional guidance as to whether required reactive compensation can be static or a portion must be dynamic (such as a SVC). During the PISIS and/or DISIS Stability issues are considered for transmission reinforcement under ERIS. Generators that fail to meet low voltage ride-through requirements (FERC Order #661-A) or SPP's stability criteria for damping or dynamic voltage recovery are assigned upgrades such that these requirements can be met.

3.1.4 Upgrades Assigned

Thermal overloads that require transmission support to mitigate are discussed in Section 8 and listed in Appendix G. All of these upgrades are cost assigned in Appendix E and Appendix F.

Other network constraints not requiring transmission reinforcements are shown in Appendix H. With a defined source and sink in a Transmission Service Request, this list of network constraints can be refined and expanded to account for all Network Upgrade requirements for firm transmission service. Additional constraints identified by multi-element contingencies are listed in Appendix I.

In no way does the list of constraints in Appendix G identify all potential constraints that guarantee operation for all periods of time. It should be noted that although this study analyzed many of the most probable contingencies, it is not an all-inclusive list and cannot account for every operational situation. Because of this, it is likely that the Customer(s) may be required to reduce their generation output to 0 MW, also known as curtailment, under certain system conditions to allow system operators to maintain the reliability of the transmission network.

3.1.5 Identification of Electrically Isolated Groups and Requests

From the FCITC analysis, it may be determined that some of the regional groups had no common impacts with the other groups. However, this determination may change as the Interconnection Customers depending upon the time at which the interconnection customers enter either the Preliminary Interconnection System Impact Study (PISIS) an/or the Definitive Interconnection System Impact Study (DISIS).

4 Determination of Cost Allocated Network Upgrades

Cost Allocated Network Upgrades of Variable Energy Resources (VER) (solar/wind) generation interconnection requests are determined using the 2017 spring model. Cost Allocated Network Upgrades of peaking units is determined using the 2020 summer peak model. A PSS/E and MUST sensitivity analysis is performed to determine the Distribution Factors (DF), a distribution factor with no contingency that each generation interconnection request has on each new upgrade. The impact each generation interconnection request has on each upgrade project is weighted by the size of each request. Finally the costs due by each request for a particular project are then determined by allocating the portion of each request's impact over the impact of all affecting requests.

For example, assume that there are three Generation Interconnection requests, X, Y, and Z that are responsible for the costs of Upgrade Project '1'. Given that their respective PTDF for the project have been determined, the cost allocation for Generation Interconnection request 'X' for Upgrade Project 1 is found by the following set of steps and formulas:

- Determine an Impact Factor on a given project for all responsible GI requests:

$$\text{Request X Impact Factor on Upgrade Project 1} = \text{DF}(\%)(X) * \text{MW}(X) = X1$$

$$\text{Request Y Impact Factor on Upgrade Project 1} = \text{DF}(\%)(Y) * \text{MW}(Y) = Y1$$

$$\text{Request Z Impact Factor on Upgrade Project 1} = \text{DF}(\%)(Z) * \text{MW}(Z) = Z1$$

- Determine each request's Allocation of Cost for that particular project:

$$\text{Request X's Project 1 Cost Allocation (\$)} = \frac{\text{Network Upgrade Project 1 Cost(\$)} * X1}{X1 + Y1 + Z1}$$

- Repeat previous for each responsible GI request for each Project

The cost allocation of each needed Network Upgrade is determined by the size of each request and its impact on the given project. This allows for the most efficient and reasonable mechanism for sharing the costs of upgrades.

4.1.1 Credits/Compensation for Amounts Advanced for Network Upgrades

Interconnection Customer shall be entitled to either credits or potentially Long Term Congestion Rights (LTCR), otherwise known as compensation, in accordance with Attachment Z2 of the SPP Tariff for any Network Upgrades, including any tax gross-up or any other tax-related payments associated with the Network Upgrades, and not refunded to the Interconnection Customer.

5 Required Interconnection Facilities

The generator Interconnection Customers requested interconnection with the transmission systems of Nebraska Public Power District (NPPD), Basin Electric Power Cooperative (BEPC), Southwestern Public Service Company (SPS), and Tri-State Generation & Transmission (TSGT).

The requirement to interconnect the 1,226 MW of generation into the existing and proposed transmission systems in the affected areas of the SPP transmission footprint consist of the necessary cost allocated shared facilities listed in Appendices E and F. The total estimated minimum cost for interconnecting the FCS-2016-003 Interconnection Customers is estimated in **Table 2** and is also shown in Appendix E and F. This total cost estimate is contingent upon higher queued customers paying for certain required network upgrades.

Appendices E and F also include Interconnection Facilities specific to each generation interconnection request. The one-line diagrams in Appendix D should be consulted for details of the alternate POIs. Separate cost allocations are included in this report for the alternate Points of Interconnection.

For an explanation of how required Network Upgrades and Interconnection Facilities were determined, refer to the section on “Identification of Network Constraints” above.

A preliminary one-line drawing for each generation interconnection request is listed in Appendix D.

5.1.1 Facilities Analysis

Not applicable to the Feasibility Cluster Study (FCS) and will be conducted during the DISIS.

5.1.2 Environmental Review

For Interconnection Requests that result in an interconnection to, or modification to, the transmission facilities of the Western-UGP, a National Environmental Policy Act (NEPA) Environmental Review will be required. The Interconnection Customer will be required to execute and Environmental Review Agreement per Section 8.6.1 of the GIP.

6 Affected Systems Coordination

Impacts to affected systems will be coordinated with the Affected System operators if the Interconnection Request(s) enter into the Definitive Interconnection System Impact Study Queue. Constraints identified to affected system during this analysis are in Appendix H-AS.

7 Power Flow Analysis

7.1.1 Power Flow Analysis Methodology

The Direct Current (DC) FCITC function of PSS® MUST was used to simulate single element and special (i.e., breaker-to-breaker, multi-element, etc.) contingencies in portions or all of the modeled control areas of SPP, as well as, other control areas external to SPP and the resulting scenarios analyzed. This satisfies the “more probable” contingency testing criteria mandated by NERC and the SPP criteria.

7.1.2 Power Flow Analysis

A power flow analysis is conducted for each Interconnection Customer’s facility using modified versions of the 2016 winter, 2017 spring and summer, 2020 light load, summer and winter, and 2025 summer peaks. The output of the Interconnection Customer’s facility is offset in each model by a reduction in output of existing online SPP generation. This method allows the request to be studied as an Energy Resource Interconnection Service request (ERIS). Certain requests that are also pursuing Network Resource Interconnection Service (NRIS) have an additional analysis conducted for displacing resources in the interconnecting Transmission Owner’s balancing area.

This analysis was conducted assuming that previous queued requests in the immediate area of these interconnect requests were in-service. The analysis of the each Customer’s project indicates that criteria violations will occur on the SPP transmission system under steady state and contingency conditions in the peak seasons.

The need for reactive compensation will be determined during the Interconnection System Impact Study. The need for reactive compensation will be based on the Interconnection Customer’s choice of wind turbine make and manufacturer. Dynamic Stability studies performed as part of the System Impact Cluster Study will provide additional guidance as to whether the reactive compensation can be static or a portion must be dynamic (such as a SVC or STATCOM). It is possible that an SVC or STATCOM device will be required at the Customer facility because of FERC Order 661-A Low Voltage Ride-Through Provisions (LVRT) which went into effect January 1, 2006. FERC Order 661-A orders that wind farms stay on-line for 3-phase faults at the point of interconnection even if that requires the installation of a SVC or STATCOM device.

8 Power Flow Results

8.1 Cluster Group 1 (Woodward Area)

In addition to the 7,644.3 MW of previously queued generation in the area, 0.0 MW of new interconnection service was studied. No new constraints were found in this area.

8.2 Cluster Group 2 (Hitchland Area)

In addition to the 4,421.8 MW of previously queued generation in the area, 0.0 MW of new interconnection service was studied. No new constraints were found in this area.

8.3 Cluster Group 3 (Spearville Area)

In addition to the 4,073.0 MW of previously queued generation in the area, 0.0 MW of new interconnection service was studied.

8.4 Cluster Group 4 (Northwest Kansas Area)

In addition to the 2,206.0 MW of previously queued generation in the area, 0.0 MW of new interconnection service was studied.

8.5 Cluster Group 6 (South Texas Panhandle/New Mexico) Area

In addition to the 7,530.07 MW of previously queued generation in the area, 866.0 MW of new interconnection service was studied. Eight (8) Point of Interconnection Scenarios were analyzed for Group 9. ERIS and NRIS constraints that could be possibly mitigated by higher queued, DISIS-2016-001, generation are listed within **Table 3** and **4**. These constraints can be reviewed in detail in Appendix G. Higher queued constraints will require transmission reinforcements at the possible cost responsibility of higher queued projects. Should these study cost assignments change during the completion of the DISIS-2016-001, then the cost responsibilities could be assigned to FCS-2016-003 requests should they proceed into the next subsequent PISIS or DISIS. In this DC analysis potential system stability limits such potential AC voltage collapse for N-1 outages of SPS to SPP tie lines are not mitigated, however they could be required to be mitigated if the requests proceed to an AC system study.

Point of Interconnection Scenario #1 ERIIS analyses observed the need to replace terminal equipment for Crossroads – Tolk 345kV, Oasis Interchange – San Juan 230kV, build additional bus tie breakers for Tolk – Tolk West 230kV and Eddy – Eddy North 230kV. Additionally, a second circuit Tolk 345/115/13kV transformer is required for mitigation.

Point of Interconnection Scenario #4 ERIS analyses observed the need to replace terminal equipment for Crossroads – Tolk 345kV, Oasis Interchange – San Juan 230kV, build additional bus tie breakers for Tolk – Tolk West 230kV and Eddy – Eddy North 230kV. Additionally, a second circuit Tolk 345/115/13kV transformer is required for mitigation.

8.6 Cluster Group 7 (Southwestern Oklahoma Area)

In addition to the 2,687.4 MW of previously queued generation in the area, 0.0 MW of new interconnection service was studied. No new constraints were found in this area.

8.7 Cluster Group 8 (North Oklahoma/South Central Kansas Area)

In addition to the 9,526.16 MW of previously queued generation in the area, 0.0 MW of new interconnection service was studied.

8.8 Cluster Group 9 (Nebraska Area)

In addition to the 5346.30 MW of previously queued generation in the area, 360.0 MW of new interconnection service was studied. Four (4) Point of Interconnection Scenarios were analyzed for Group 9. ERIS and NRIS constraints that could be possible mitigated by higher queued, DISIS-2016-001, generation are listed within **Table 29** and **30**. These constraints can be reviewed in detail in Appendix G. Higher queued constraints will require transmission reinforcements at the possible cost responsibility of higher queued projects. Should these study cost assignments change during the completion of the DISIS-2016-001, then the cost responsibilities could be assigned to FCS-2016-003 requests should they proceed into the next subsequent PISIS or DISIS. In this DC analysis potential system stability limits such as Gentleman Generation Station (GGS) Stability Limit are not mitigated, however they could be required to be mitigated if the requests proceed to an AC system study.

8.9 Cluster Group 10 (Southeast Oklahoma/Northeast Texas Area)

In addition to the 0.0 MW of previously queued generation in the area, 0.0 MW of new interconnection service was studied. No new constraints were found in this area.

8.10 Cluster Group 12 (Northwest Arkansas Area)

In addition to the 30.0 MW of previously queued generation in the area, 0.0 MW of new interconnection service was studied. No new constraints were found in this area.

8.11 Cluster Group 13 (Northeast Kansas/Northwest Missouri Area)

In addition to the 679.10 MW of previously queued generation in the area, 0.0 MW of new interconnection service was studied. No new constraints were found in this area.

8.12 Cluster Group 14 (South Central Oklahoma Area)

In addition to the 1,616.0 MW of previously queued generation in the area, 0.0 MW of new interconnection service was studied.

8.13 Cluster Group 15 (Eastern South Dakota)

In addition to approximately 2,326.4 MW of previously queued generation in the area, 0.0 MW of new interconnection service was studied.

8.14 Cluster Group 16 (Western North Dakota)

In addition to approximately 4,527.41 MW of previously queued generation in the area, 0.0 MW of new interconnection service was studied.

8.15 Cluster Group 17 (Western and South Central South Dakota)

In addition to approximately 673.9 MW of previously queued generation in the area, 0.0 MW of new interconnection service was studied.

8.16 Cluster Group 18 (Eastern North Dakota)

In addition to approximately 261.5 MW of previously queued generation in the area, 0.0 MW of new interconnection service was studied. No new constraints were found in this area.

8.17 Curtailment and System Reliability

In no way does this study guarantee operation for all periods of time. It should be noted that although this study analyzed many of the most probable contingencies, it is not an all-inclusive list and cannot account for every operational situation. Because of this, it is likely that the Customer(s) may be required to reduce their generation output to 0 MW, also known as curtailment, under certain system conditions to allow system operators to maintain the reliability of the transmission network.

9 Conclusion

The minimum cost of interconnecting 1,226 MW of new interconnection requests included in this Feasibility Cluster Study are listed in Appendices E and F, which include the Allocated Network Upgrades and Transmission Owner Interconnection Facilities.

Within the study scope of the Feasibility Cluster Studies, two (2) Points of Interconnection (primary or secondary POI) assumption analyses were conducted for GEN-2016-074, GEN-2016-076, GEN-2016-079, GEN-2016-085, and GEN-2016-086.

Twelve (12) scenario assumption analyses were conducted for the current study to account for GEN-2016-074, GEN-2016-076, GEN-2016-085, and GEN-2016-086 primary and secondary POIs. **Table 1** displays the Twelve (12) Energy Resource Interconnection Service (ERIS) and Network Resources Interconnection Service (NRIS) analyses that were performed.

If the Interconnection Customers proceed into the Preliminary Interconnection System Impact Study (PISIS) or Definitive Interconnection System Impact Study (DISIS), the Interconnection Customer can propose only one Point of Interconnection (POI).

The total estimated minimum cost assigned to Interconnection Customers for each interconnecting scenario is estimate in the following table and is also show in Appendix E and F.

Table 43: Total Estimated Minimum Cost

Scenario Number	Total Estimated Minimum Cost
Scenario #1	\$153,600,000
Scenario #2	\$143,600,000
Scenario #3	\$143,100,000
Scenario #4	\$153,100,000
Scenario #5	\$79,000,000
Scenario #6	\$66,000,000
Scenario #7	\$68,250,000
Scenario #8	\$79,000,000
Scenario #9	\$118,000,000
Scenario #10	\$119,000,000
Scenario #11	\$105,000,000
Scenario #12	\$81,000,000

This total cost estimate is contingent upon higher queued customers paying for certain required network upgrades. Additionally, the total cost estimates are contingent on potential DISIS-2016-001 identified upgrades.

The one-line diagrams in Appendix D should be consulted for details of the alternate POIs. These costs do not include the Interconnection Customer Interconnection Facilities as defined by the SPP Open Access Transmission Tariff (OATT). This cost does not include the possible need for reactive

compensation or additional interconnection facilities or network upgrades that may be identified through additional analyses performed in the PISIS and DISIS.

The powerflow results listed in this report were obtained by analyzing the 1,226 MW of Feasibility Study Interconnection Requests in addition to prior queued Interconnection Requests up to and including DISIS-2016-001. DISIS-2016-001 study is not completed yet; however DISIS-2016-001 Interconnection Requests could be cost assigned potential Network Upgrades identified in this feasibility study analysis as non-incremental constraints as a result of FCS-2016-003 Interconnection Service addition. Those DC analysis constraints can be found in the Contingency Upgrade section. Please note DISIS-2016-001 AC contingency analysis has not been conducted and could result in additional upgrades and/or constraints. If any Interconnection Requests are withdrawn from the higher queued studies including DISIS-2016-001, then potential upgrades tentatively assigned to those Interconnection Requests may be assigned to the Interconnection Requests in this FCS-2016-003 study once these Interconnection Requests execute a Definitive Interconnection System Impact Study Agreement.

These interconnection costs do not include any cost of Network Upgrades determined to be required by AC power flow analysis, short circuit or transient stability analysis. These studies will be performed if the Interconnection Customer executes the appropriate Interconnection System Impact Study Agreement and provides the required data along with demonstration of Site Control and the appropriate deposit. At the time of the System Impact Cluster Study, a better determination of the interconnection facilities may be available.

The required interconnection costs listed in Appendices E and F, and other upgrades associated with Network Constraints do not include all costs associated with the deliverability of the energy to final customers. These costs are determined by separate studies if the Customer submits a Transmission Service Request (TSR) through SPP's Open Access Same Time Information System (OASIS) as required by Attachment Z1 of the SPP Open Access Transmission Tariff (OATT).

* Interconnection Costs assumption does not account for conversion costs to breaker-and-a-half should the Transmission Owner deem the conversion necessary for the addition of the new line terminal

10.5 E: Cost Allocation per Interconnection Request (Including Prior Queued Upgrades)

Important Note:

****WITHDRAWAL OF HIGHER QUEUED PROJECTS WILL CAUSE A RESTUDY AND MAY RESULT IN HIGHER INTERCONNECTION COSTS****

This section shows each Generator Interconnection Request Customer, their current study impacted Network Upgrades, and the previously allocated upgrades upon which they rely to accommodate their interconnection to the transmission system.

The costs associated with the current study Network Upgrades are allocated to the Customers shown in this report.

In addition should a higher queued request, defined as one this study includes as a prior queued request, withdraw, the Network Upgrades assigned to the withdrawn request may be reallocated to the remaining requests that have an impact on the Network Upgrade under a restudy. Also, should an Interconnection Request choose to go into service prior to the operation date of any necessary Network Upgrades, the costs associated with those upgrades may be reallocated to the impacted Interconnection Request. The actual costs allocated to each Generator Interconnection Request Customer will be determined at the time of a restudy.

The required interconnection costs listed do not include all costs associated with the deliverability of the energy to final customers. These costs are determined by separate studies if the Customer submits a Transmission Service Request through SPP's Open Access Same Time Information System (OASIS) as required by Attachment Z1 of the SPP OATT. In addition, costs associated with a short circuit analysis will be allocated should the Interconnection Request Customer choose to execute a Interconnection Facilities Study Agreement.

10.6 F: Cost Allocation per Proposed Study Network Upgrade

Important Note:

****WITHDRAWAL OF HIGHER QUEUED PROJECTS WILL CAUSE A RESTUDY AND MAY RESULT IN HIGHER INTERCONNECTION COSTS****

This section shows each Direct Assigned Facility and Network Upgrade and the Generator Interconnection Request Customer(s) which have an impact in this study assuming all higher queued projects remain in the queue and achieve commercial operation.

The required interconnection costs listed do not include all costs associated with the deliverability of the energy to final customers. These costs are determined by separate studies if the Customer submits a Transmission Service Request through SPP's Open Access Same Time Information System (OASIS) as required by Attachment Z1 of the SPP OATT. In addition, costs associated with a short circuit analysis will be allocated should the Interconnection Request Customer choose to execute a Facility Study Agreement.

There may be additional costs allocated to each Customer. See Appendix E for more details.
