1 EXECUTIVE SUMMARY

An Affected System Interconnection Customer has requested an Affected System Impact Study (ASIS) consistent with Southwest Power Pool (SPP) Open Access Transmission Tariff (OATT) for interconnection requests into the system of Associated Electric Cooperative Inc. (AECI). AECI request GI-59/SIS-30, 158.6 MW wind generating facility, has been assigned the SPP queue identifier ASGI-2017-008.

This ASIS addresses the effects to the SPP system of interconnecting the generator to the AECI transmission system for the system topology and requests included in SPP DISIS-2016-001 or latest iteration. ASGI-2017-008 is requesting the interconnection of fifty-seven (57) 2.5 MW General Electric (G.E.) and seven (7) 2.3 MW G.E. wind turbines for a total of 158.6 MW injection at the Point of Interconnection (POI) and associated facilities interconnecting to AECI at the line tap of Remington 138 kV to Shidler 138 kV substations in Osage County, OK.

The ASIS analysis has determined that the ASGI-2017-008 request can interconnect 158.6 MW of generation with Energy Resource Interconnection Service (ERIS) and Network Resource Interconnection Service (NRIS) with the study dispatch assumption listed in **Table 1** after the completion of the required Network Upgrades, listed within **Table 2** of this report.

It should be noted that although this ASIS analyzed many of the most probable contingencies, it is not an all-inclusive list that can account for every operational situation. Additionally, the generator may not be able to inject any power onto the Transmission System due to constraints that fall below the threshold of mitigation for a Generator Interconnection request. Because of this, it is likely that the Customer(s) may be required to reduce their generation output to 0 MW under certain system conditions to allow system operators to maintain the reliability of the transmission network.

Transient stability analysis was not conducted for this re-study. The report from the original study of ASGI-2017-008 includes the results of the stability analysis, and that report may be reviewed if needed.

Nothing in this study should be construed as a guarantee of delivery or transmission service. If the customer(s) wishes to move power across the facilities of SPP, a separate request for transmission service must be made on Southwest Power Pool's OASIS by the Customer(s).

2 PURPOSE

An Affected System Interconnection Customer has requested an Affected System Impact Study (ASIS) consistent with the Southwest Power Pool (SPP) Open Access Transmission Tariff (OATT) for interconnection requests into the system of Associated Electric Cooperative Inc. (AECI).

The purpose of this re-study is to evaluate the impacts of interconnecting the AECI GI-059/SIS-30 request assigned the SPP queue identifier ASGI-2017-008 with the consideration of AECI request GI-052/SIS-23 withdrawing its request for interconnection. ASGI-2017-008 is requesting the interconnection of fifty-seven (57) 2.5 MW General Electric (G.E.) and seven (7) 2.3 MW G.E. wind turbines for a total of 158.6 MW injection at the Point of Interconnection (POI) and associated facilities interconnecting to AECI at the Remington – Shidler 138 kV line in Osage County, OK.

The ASIS considers the Base Case as well as all Generating Facilities (and with respect to (b) below, any identified Network Upgrades associated with such higher queued interconnection) that, on the date the ASIS is commenced:

- a) are directly interconnected to the Transmission System;
- b) are interconnected to Affected Systems and may have an impact on the Interconnection Request;
- c) have a pending higher queued Interconnection Request to interconnect to the Transmission System listed in **Table 1**; or
- d) have no Queue Position but have executed an LGIA or requested that an unexecuted LGIA be filed with FERC.

Any changes to these assumptions, for example, one or more of the previously queued requests not included within this study execute an interconnection agreement and commencing commercial operation, may require a re-study of this ASIS at the expense of the Customer(s).

Nothing within this System Impact Study constitutes a request for transmission service or confers upon the Interconnection Customer(s) any right to receive transmission service rights. Should the Customer(s) require transmission service, those rights should be requested through SPP's Open Access Same-Time Information System (OASIS) or that of the applicable transmission provider.

This ASIS included prior queued generation interconnection requests. Those listed within **Table 1** are the generation interconnection requests that are assumed to have rights to either full or partial interconnection service prior to the requested in-service for this ASIS. Also listed in **Table 1** are both the amount of MW of interconnection service expected at the effective time of this study and the total MW requested of interconnection service, the fuel type, the Point of Interconnection (POI), and the current status of each particular prior queued request.

This ASIS was required because the Affected System Interconnection Customer(s) are requesting interconnection at a location electrically close to the SPP system. The re-study of this ASIS is required due to AECl interconnection request GI-052/SIS-23 withdrawing from its interconnection request.

Table 2: Upgrade Projects Required for Interconnection Service

below list the higher and current study queued required upgrade projects with associated requests have cost responsibility.

DISIS-2016-001-2 Group 08 Impact Study was posted July 29, 2018.

DISIS-2016-001-2 reports can be located at the following Generation Interconnection Study URL:

Table 2: Upgrade Projects Required for Interconnection Service

Upgrade Project	Type	Description	Status	Study Assignment
GEN-2015-063 Tap – Mathewson 345 kV CKT 1 (Included in Scenario 0)	Structure Replacements	Replace terminal equipment and structures to achieve conductor limit	IAs Executed	DISIS-2015-002-4 (ERIS/NRIS)
Farber – Belle Plains 138kV CKT 1 (Included in Scenario 0)	Rebuild	Rebuild approximately 10 miles of 138kV from Farber – Belle Plains	Facility Study	DISIS-2016-001-2 (ERIS)
Middleton Tap – Chilocco 138kV CKT 1 (Included in Scenario 0)	Rebuild	Rebuild approximately 5.7 miles of 138kV from Middleton Tap – Chilocco	Assigned to SPP Higher Queued Impact Study	DISIS-2016-001-2 (ERIS)
GEN-2015-063 Tap – Woodring 345 kV CKT 1 (Included in Scenario 0)	Rerate	Rerate of GEN-2015-063 Tap – Woodring 345 kV	Assigned to SPP Higher Queued Impact Study	DISIS-2016-001-2 (ERIS)
LaCygne - Waverly 345 kV CKT 1 (Included in Scenario 0)	Assigned to SPP Higher Queued Impact Study	Upgrade the terminal equipment on the LaCygne– Waverly 345 kV	Assigned to SPP Higher Queued Impact Study	DISIS-2016-001-2 (ERIS)
Ranch Road – Sooner 345 kV CKT 1 (Included in Scenario 0)	Upgrade Terminal Equipment	Upgrade the terminal equipment on the Ranch Road – Sooner 345 kV	Assigned to SPP Higher Queued Impact Study	DISIS-2016-001-2 (ERIS)
Fairfax – 138/69kV Transformer CKT 2 (Included in Scenario 0)	Build	Build an additional 138/69kV transformer at Fairfax substation	Assigned by AECI	Assigned to ASGI-2017-008 (AECI GI-059) per AECI Impact Study
Fairfax – Naval Reserve 69kV CKT 1 (Included in Scenario 0)	Uprate	Uprate of approximately 8.7 miles of 69kV from Fairfax to Naval Reserve	Assigned by AECI	Assigned to ASGI-2017-008 (AECI GI-059) per AECI Impact Study
Fairfax – Remington 138kV CKT 1 (Included in Scenario 0)	Rebuild	Rebuild approximately 8.6 miles of 138kV from Fairfax to Remington	Assigned by AECI	Assigned to ASGI-2017-008 (AECI GI-059) per AECI Impact Study
GI-059 Tap – Shidler 138kV CKT 1 (Included in Scenario 0)	Rebuild	Rebuild approximately 0.25 miles of 138kV from GI-059 Tap to Shidler	Assigned by AECI	Assigned to ASGI-2017-008 (AECI GI-059) per AECI Impact Study
Naval Reserve – Pawya – Pershing Tap 69kV CKT 1 (Included in Scenario 0)	Uprate	Uprate of approximately 14.7 miles of 69 kV from Naval Reserve to Pershing Tap	Assigned by AECI	Assigned to ASGI-2017-008 (AECI GI-059) per AECI Impact Study
Shidler – West Pawhuska – Pawhuska Tap – Domes – Mound Road – Bartlesville 138kV CKT 1*	Rebuild	Rebuild approximately 43 miles of 138kV from Shidler – Bartlesville 138kV to achieve at least 161MVA Summer Peak Normal (Rate A) and 242 Summer Peak Emergency (Rate B)	Current Study	Assigned to ASGI-2017-008 (AECI GIA-059) cost allocation of \$75,811,843 (ERIS)

* Upgrades denoted will require an SPP Affected System Facilities Study agreement and deposit. These upgrades could require the need for a Construction Agreement (CA) as a result of the Affected System Facilities Study.

Any changes to these assumptions may require a re-study of this ASIS at the expense of the Customer(s).

Nothing in this System Impact Study constitutes a request for transmission service or grants the Interconnection Customer(s) any rights to transmission service.

3 FACILITIES

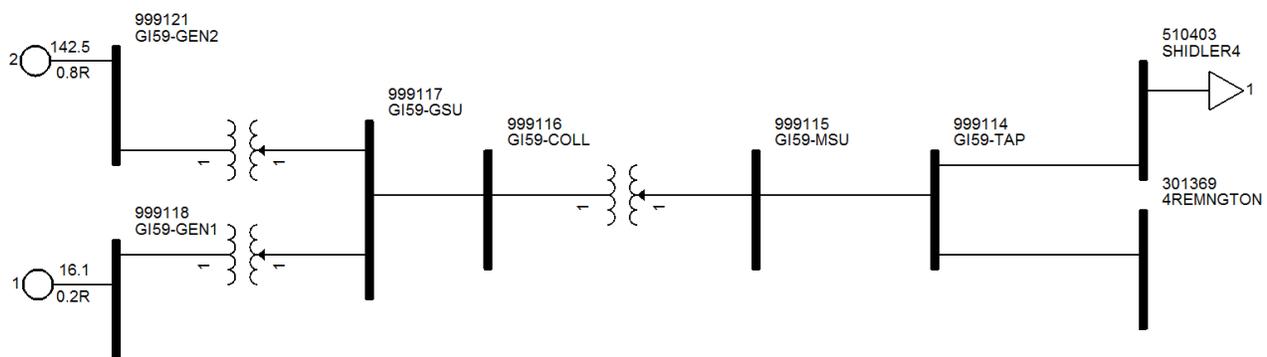

3.1 GENERATING FACILITY

The Affected System Interconnection Customers' request the interconnection of fifty-seven (57) 2.5 MW General Electric (G.E.) and seven (7) 2.3 MW G.E. wind turbines for a total of 158.6 MW injection at the Point of Interconnection (POI) and associated facilities interconnecting to AECI at the Remington – Shidler 138 kV line in Osage County, OK.

3.2 INTERCONNECTION FACILITIES

The POI for ASGI-2017-008 Interconnection Customer connects to the Affected System the Remington – Shidler 138 kV line in Osage County, OK. **Figure 1** depicts the one-line diagram for the POI and the Interconnection Request(s).

Figure 1: Proposed ASGI-2017-008 Configuration and Request Power Flow Model

3.3 BASE CASE NETWORK UPGRADES

The Network Upgrades included within the cases used for this Affected System Impact Study are those facilities that are a part of the SPP Transmission Expansion Plan or the Balanced Portfolio projects. These facilities have an approved Notification to Construct (NTC), or are in construction stages and expected to be in-service at the effective time of this study. No other upgrades were included for this ASIS. If for some reason, construction on these projects is delayed or discontinued, a restudy may be needed to determine the interconnection service availability of the Customer(s).

4 POWER FLOW ANALYSIS

Power flow analysis is used to determine if the transmission system can accommodate the injection from the request without violating thermal or voltage transmission planning criteria.

4.1 MODEL PREPARATION

Power flow analysis was performed using modified versions of the 2016 model series of 2017 ITP Near-Term study models including these seasonal models:

- Year 1 (2017) Winter Peak (17WP)
- Year 2 (2018) Spring (18G)
- Year 2 (2018) Summer Peak (18SP)
- Year 5 (2021) Light (21L)
- Year 5 (2021) Summer (21SP)
- Year 5 (2021) Winter (21WP) peak
- Year 10 (2026) Summer (26SP) peak

To incorporate the Interconnection Customers' request, a re-dispatch of existing generation within SPP and AECl was performed with respect to the amount of the Customers' injection.

For Variable Energy Resources (VER) (solar/wind) in each power flow case, ERIS, is evaluated for the generating plants within a geographical area of the interconnection request(s) for the VERs dispatched at 100% nameplate of maximum generation. The VERs in the remote areas is dispatched at 20% nameplate of maximum generation. SPP projects are dispatched across the SPP footprint using load factor ratios. AECl projects are dispatched across the AECl footprint using load factor ratios.

Peaking units are not dispatched in the Year 2 spring and Year 5 light, or in the "High VER" summer and winter peaks. To study peaking units' impacts, the Year 1 winter peak, Year 2 summer peak, and Year 5 summer and winter peaks, and Year 10 summer peak models are developed with peaking units dispatched at 100% of the nameplate rating and VERs dispatched at 20% of the nameplate rating. Each interconnection request is also modeled separately at 100% nameplate for certain analyses.

All generators (VER and peaking) that requested Network Resource Interconnection Service (NRIS) are dispatched in an additional analysis into the interconnecting Transmission Owner's (T.O.) area at 100% nameplate with Energy Resource Interconnection Service (ERIS) only requests at 80% nameplate. This method allows for identification of network constraints that are common between regional groupings to have affecting requests share the mitigating upgrade costs throughout the cluster.

For this ASIS, only the previous queued requests listed in **Table 1** were assumed to be in-service at 100% dispatch.

4.2 STUDY METHODOLOGY AND CRITERIA

THERMAL OVERLOADS

Network constraints are found by using PSS/E AC Contingency Calculation (ACCC) analysis with PSS/E MUST First Contingency Incremental Transfer Capability (FCITC) analysis on the entire cluster grouping dispatched at the various levels previously mentioned.

For ERIS, thermal overloads are determined for system intact (n-0) (greater than or equal to 100% of Rate A - normal) and for contingency (n-1) (greater than or equal to 100% of Rate B – emergency) conditions.

The overloads are then screened to determine which of generator interconnection requests have at least

- 3% Distribution Factor (DF) for system intact conditions (n-0),
- 20% DF upon outage based conditions (n-1),
- or 3% DF on contingent elements that resulted in a non-converged solution.

Interconnection Requests that requested NRIS are also studied in a separate NRIS analysis to determine if any constraint measured greater than or equal to a 3% DF. If so, these constraints are also considered for transmission reinforcement under NRIS.

The contingency set includes all SPP control area branches and ties 69kV and above, first tier Non-SPP control area branches and ties 115 kV and above, any defined contingencies for these control areas, and generation unit outages for the SPP control areas with SPP reserve share program redispatch.

The monitored elements include all SPP control area branches, ties, and buses 69 kV and above, and all first tier Non-SPP control area branches and ties 69 kV and above. NERC Power Transfer Distribution Flowgates for SPP and first tier Non-SPP control area are monitored. Additional NERC Flowgates are monitored in second tier or greater Non-SPP control areas. Voltage monitoring was performed for SPP control area buses 69 kV and above.

VOLTAGE

For non-converged power flow solutions that are determined to be caused by lack of voltage support, appropriate transmission support will be determined to mitigate the constraint.

After all thermal overload and voltage support mitigations are determined; a full ACCC analysis is then performed to determine voltage constraints. The following voltage performance guidelines are used in accordance with the Transmission Owner local planning criteria.

SPP Areas (69kV+):

Transmission Owner	Voltage Criteria (System Intact)	Voltage Criteria (Contingency)
AEPW	0.95 – 1.05 pu	0.92 – 1.05 pu
GRDA	0.95 – 1.05 pu	0.90 – 1.05 pu
SWPA	0.95 – 1.05 pu	0.90 – 1.05 pu
OKGE	0.95 – 1.05 pu	0.90 – 1.05 pu
OMPA	0.95 – 1.05 pu	0.90 – 1.05 pu
WFEC	0.95 – 1.05 pu	0.90 – 1.05 pu
SWPS	0.95 – 1.05 pu	0.90 – 1.05 pu
MIDW	0.95 – 1.05 pu	0.90 – 1.05 pu
SUNC	0.95 – 1.05 pu	0.90 – 1.05 pu
KCPL	0.95 – 1.05 pu	0.90 – 1.05 pu
INDN	0.95 – 1.05 pu	0.90 – 1.05 pu
SPRM	0.95 – 1.05 pu	0.90 – 1.05 pu
NPPD	0.95 – 1.05 pu	0.90 – 1.05 pu
WAPA	0.95 – 1.05 pu	0.90 – 1.05 pu
WERE L-V	0.95 – 1.05 pu	0.93 – 1.05 pu
WERE H-V	0.95 – 1.05 pu	0.95 – 1.05 pu
EMDE L-V	0.95 – 1.05 pu	0.90 – 1.05 pu
EMDE H-V	0.95 – 1.05 pu	0.92 – 1.05 pu
LES	0.95 – 1.05 pu	0.90 – 1.05 pu
OPPD	0.95 – 1.05 pu	0.90 – 1.05 pu

SPP Buses with more stringent voltage criteria:

Bus Name/Number	Voltage Criteria (System Intact)	Voltage Criteria (Contingency)
TUCO 230kV 525830	0.925 – 1.05 pu	0.925 – 1.05 pu
Wolf Creek 345kV 532797	0.985 – 1.03 pu	0.985 – 1.03 pu
FCS 646251	1.001 – 1.047 pu	1.001 – 1.047 pu

Affected System Areas (115kV+):

Transmission Owner	Voltage Criteria (System Intact)	Voltage Criteria (Contingency)
AECI	0.95 – 1.05 pu	0.90 – 1.05 pu
EES-EAI	0.95 – 1.05 pu	0.90 – 1.05 pu
LAGN	0.95 – 1.05 pu	0.90 – 1.05 pu
EES	0.95 – 1.05 pu	0.90 – 1.05 pu
AMMO	0.95 – 1.05 pu	0.90 – 1.05 pu
CLEC	0.95 – 1.05 pu	0.90 – 1.05 pu
LAFA	0.95 – 1.05 pu	0.90 – 1.05 pu
LEPA	0.95 – 1.05 pu	0.90 – 1.05 pu
XEL	0.95 – 1.05 pu	0.90 – 1.05 pu
MP	0.95 – 1.05 pu	0.90 – 1.05 pu
SMMPA	0.95 – 1.05 pu	0.90 – 1.05 pu
GRE	0.95 – 1.05 pu	0.90 – 1.10 pu
OTP	0.95 – 1.05 pu	0.90 – 1.05 pu
OTP-H (115kV+)	0.97 – 1.05 pu	0.92 – 1.10 pu
ALTW	0.95 – 1.05 pu	0.90 – 1.05 pu
MEC	0.95 – 1.05 pu	0.90 – 1.05 pu
MDU	0.95 – 1.05 pu	0.90 – 1.05 pu
SPC	0.95 – 1.05 pu	0.95 – 1.05 pu
DPC	0.95 – 1.05 pu	0.90 – 1.05 pu
ALTE	0.95 – 1.05 pu	0.90 – 1.05 pu

The constraints identified through the voltage scan are then screened for the following for each interconnection request. 1) 3% DF on the contingent element and 2) 2% change in pu voltage. In certain conditions, engineering judgement was used to determine whether or not a generator had impacts to voltage constraints.

RESULTS

The ASIS ACCC analysis indicates that the Affected System Interconnection Customer(s) can interconnect their generation into the AECI transmission system at the available MW listed in the results tables after all required upgrades listed within the DISIS-2016-001 studies or latest iteration can be placed into service. ACCC results in **Table 3** and **Table 4** are dependent on higher queued SPP and AECI upgrades. Incremental SPP upgrades assigned to ASGI-2017-008 can be identified within **Table 2**.

CURTAILMENT AND SYSTEM RELIABILITY

In no way does this study guarantee operation for all periods of time. It should be noted that although this study analyzed many of the most probable contingencies, it is not an all-inclusive list and cannot account for every operational situation. Because of this, it is likely that the Customer(s) may be required to reduce their generation output to **0 MW** under certain system conditions to allow system operators to maintain the reliability of the transmission network.

5 STABILITY ANALYSIS

Transient stability analysis is used to determine if the transmission system can maintain angular stability and ensure bus voltages stay within planning criteria bandwidth during and after a disturbance while considering the addition of a generator interconnection request. Please refer to the posting of the original ASGI-2017-008 report for the results of the stability analysis. It was determined that no additional stability analysis was necessary for this re-study. The results of the original ASGI-2017-008 Affected Systems study can be found here:

http://sppoasis.spp.org/documents/swpp/transmission/studies/files/2017_Generation_Studies/ASGI-2017-008_REPORT_FINAL-R0.pdf

6 CONCLUSION

An Affected System Interconnection Customer has requested an Affected System Impact Study (ASIS) under the Southwest Power Pool Open Access Transmission Tariff (OATT) for ASGI-2017-008. ASGI-2017-008 (158.6 MW) wind generating facilities is to be interconnected into the system of AECL. ASGI-2017-008 has requested this ASIS to determine the impacts of interconnecting to the transmission system with all required Network Upgrades identified in the DISIS-2016-001 Impact Study placed into service.

The ASIS analysis has determined that the ASGI-2017-008 request can interconnect 158.6 MW of generation with ERIS and NRIS with the study dispatch assumption listed in **Table 1** provided the Network Upgrades listed in **Table 2** are able to be placed in service.

It should be noted that although this ASIS analyzed many of the most probable contingencies, it is not an all-inclusive list that can account for every operational situation. Additionally, the generator may not be able to inject any power onto the Transmission System due to constraints that fall below the threshold of mitigation for a Generator Interconnection request. Because of this, it is likely that the Customer(s) may be required to reduce their generation output to **0 MW** under certain system conditions to allow system operators to maintain the reliability of the transmission network.

Transient stability analysis was not conducted for this re-study. The report from the original study of ASGI-2017-008 includes the results of the stability analysis, and that report may be reviewed if needed.

Any changes to these assumptions, for example, one or more of the previously queued requests not included within this study execute an interconnection agreement and commencing commercial operation, may require a re-study of this ASIS at the expense of the Customer.

Nothing in this System Impact Study constitutes a request for transmission service or confers upon the Interconnection Customer any right to receive transmission service.

7 STEADY STATE THERMAL AND VOLTAGE CONSTRAINTS

Table 3: Thermal Constraints Requiring Additional Transmission Reinforcements
