1 INTRODUCTION

Incremental Long-Term Congestion Rights (ILTCRs) were made available by FERC Order 681 Guideline 3 as a reimbursement mechanism for sponsors of transmission upgrades. The guideline specifies that long-term firm transmission rights made feasible by transmission upgrades or expansions must be available upon request to any party that pays for such upgrades or expansions in accordance with the transmission organization's prevailing cost allocation methods for upgrades or expansions. Effective July 1, 2020, ILTCR is the default cost recovery mechanism for eligible Network Upgrades (NU) with Directly Assigned Upgrade Cost (DAUC) as a result of a Generation Interconnection Study (GIS), Aggregate Transmission Service Study (ATSS), or a Sponsored Upgrade Study in SPP.

The objective of the ILTCR analysis is to determine the incremental Available Transfer Capability (ATC) created on each of the Customer submitted source-to-sink paths over a ten-year period resulting from the construction of the upgrade. The Upgrade Sponsor may then have the option to use the results of this study to obtain candidate ILTCRs on the path selected.

The ILTCR study process was completed for Basin Electric Power Cooperative (BEPC) for Directly Assigned Upgrade Costs (DAUC) for the following network upgrades from the 2020-AG1 study:

- Greenwood 161 kV Terminal Upgrades
- Pleasant Hill 161kV and Lake Winnebago 161 kV Terminal Upgrades

2 STUDY INPUTS

MODEL BASIS

The 2020 ITP Base Reliability (BR) models from the 2020-AG1 were the starting point for the analysis. The following details specify the particular models utilized for this evaluation.

- Model years 2021, 2022, 2025, 2030
 - Summer Peak (2022SP, 2025SP, 2030SP)
 - Winter Peak (2021WP, 2022WP, 2025WP, 2030WP)
 - Light Load (2022LL, 2025LL, 2030LL)

MONITORED FACILITIES

The monitored elements include all SPP control area branches, ties, and buses 69 kV and above, and all first tier Non-SPP control area branches and ties 100 kV and above. NERC Power Transfer Distribution Flowgates for SPP and first tier Non-SPP control areas are monitored. Additional NERC Flowgates are monitored in second tier or greater Non-SPP control areas.

- All branches and ties within the following areas:
 - SPP Internal Areas for 60kV – 999kV facilities:
 - 515 – 546, 640 – 652, 659
- NERC, SPP, and Tier 1 Permanent Flowgates (thermal)

CONTINGENCY EVENTS

The contingency set includes all SPP control area branches and ties 69kV and above, first tier Non-SPP control area branches and ties 100 kV and above, any defined contingencies for these control areas, and generation unit outages for the SPP control areas with SPP reserve share program redispatch.

- All branches, ties, shunts, and generators within the following areas:
 - SPP Internal Areas for 60kV – 999kV facilities:
 - 515 – 546, 640 - 652, 659
 - SPP External Areas for 100kV – 999kV facilities:
- NERC, SPP, and Tier 1 Permanent Flowgates
- SPP T.O. Specific P1, P2, P4, and P5 TPL-004-1 Contingencies

TRANSFER PATHS

BEPC is eligible to select up to three (3) source-to-sink transfer paths for the Network Upgrades. The source-to-sink transfer paths selected by the BEPC are captured in the Results section.

3 STUDY METHODOLOGY

TRANSFER ANALYSIS

A DC transfer analysis was conducted to determine the limiting flowgates in each applicable case for the respective transfer paths provided by BEPC. Constraints were defined as any overloaded facility in which the transfer had a TDF of three (3) percent or greater for system intact or contingency conditions respectively.

Once the initial DC limiting flowgates were filtered to valid results, the top five (5) limiting flowgates in each applicable case for the respective transfer paths provided by BEPC were AC verified.

With the transfer limits AC verified, the deltas between the minimum AC transfer amounts across all analyzed cases for each path with and without the associated Network Upgrades were determined as follows:

- If ATC post-NU < 0, then individual increment = 0
- If ATC pre-NU < 0 and ATC post-NU > 0, then individual increment = ATC post-NU
- If ATC pre-NU > 0 and ATC post-NU > 0, then individual increment = ATC post-NU – ATC pre-NU

4 ILTCR STUDY RESULTS

Table 4-1 summarizes the minimum incremental ATC created across all seasons for each of the source-to-sink paths provided by BEPC for the Network Upgrades. No additional ATC was created for any of the source-to-sink paths.

Appendix A includes the detailed results of the top five (5) most limiting flowgates for each model and transfer path. Appendix B includes definitions of the contingencies specified in Appendix A.

Table 4-1: Minimum Incremental ATC Created by Upgrades

Source	Sink	Min Incremental ATC Created (MW)	Candidate ILTCR (MW)
BEPC.EDGELEY	WAUE.BEPC.NTWK	0	0
BEPC.HYDEWIND	WAUE.BEPC.NTWK	0	0
BEPC.LRS	WAUE.BEPC.NTWK	0	0

5 CONCLUSION

The ILTCR analysis determined no incremental ATC was created on the BEPC submitted source-to-sink paths due to the Network Upgrades. As a result, no candidate ILTCRs will be awarded. This data will be documented in BEPC's service agreement and executed before filing with FERC.
