Executive Summary

This report presents the results of an Affected System Impact Study (AFSIS) on MISO transmission system performed for Phase 3 generator interconnection requests in the Southwest Power Pool (SPP) queue 2022-001 cycle (Study Projects). The AFSIS results are summarized below.

1.1 Project List

Because of a wide geographical region of the DISIS 2022-001 Phase 3 Study Projects, the MISO AFSIS was divided into two groups to identify the impacts on the MISO West and MISO South regions.

1.1.1 Phase 3 Study Projects in MISO South

The DISIS 2022-001 Phase 3 Study Projects in MISO South region (Study Projects in MISO South) have 21 generation projects with combined energy of 3821 MW, which are listed in Table ES-1.

Table ES-1: DISIS 2022-001 Phase 3 Study Projects in MISO South

Project #	Fuel type	Town / County	State	Point of Interconnection	MW request	SH (MW)	SPK (MW)

1.1.2 Phase 3 Study Projects in MISO West

The DISIS 2022-001 Phase 3 Study Projects in MISO West region (Study Projects in MISO West) have 20 generation projects with combined energy of 4002 MW, which are listed in Table ES-2.

Table ES-2: DISIS 2022-001 Phase 3 Study Projects in MISO West

1.2 MISO AFSIS Study Summary

1.2.1 Study Summary for Study Projects in MISO South

Summer peak and summer shoulder steady state models and stability packages used for MISO AFSIS on SPP DISIS 2022-001 Study Projects in MISO South were developed from the MISO DPP 2021 South Phase 2 models and stability packages.

Steady state thermal and voltage analysis was performed to identify any thermal and voltage violations in the MISO South region. No MISO AFSIS thermal or voltage Network Upgrades were identified.

Transient stability analysis was performed to identify any transient stability violations caused by the SPP Study Projects in MISO South. No transient stability constraints were identified in the 2026 summer peak and summer shoulder scenarios. No MISO AFSIS stability NUs were identified in the transient stability analysis.

A short circuit screening analysis was conducted by comparing three phase fault currents in the benchmark and study cases for the SPP Study Projects in MISO South. Based on the screening results, MISO Transmission Owners do not plan to conduct additional studies.

No contingent MTEP facilities were identified for the SPP Study Projects in MISO South.

It should be noted that a restudy may be required if significant changes to the study assumptions occur, including but not limited to, interconnection request withdrawals and/or changes to higher-queued Network Upgrades included in the Base Case.

For the study projects that are required to mitigate thermal violations, the projects should not be allowed to come into service before the required Network Upgrades are in service, unless a MISO restudy removes the mitigation requirement from the project, or an interim limit is

provided to the project through MISO Annual ERIS process. For projects that are required to mitigate voltage violations, no injection is allowed until the allocated upgrades and contingent facilities are in service.

1.2.2 Study Summary for Study Projects in MISO West

Summer peak and summer shoulder steady state models and stability packages used for MISO AFSIS on SPP DISIS 2022-001 Study Projects in MISO West were developed from the MISO DPP 2021 West Phase 2 models and stability packages.

Steady state thermal and voltage analysis was performed to identify any thermal and voltage violations in MISO West region. MISO West AFSIS Thermal Network Upgrades are listed in Table ES-3. No voltage constraints were identified.

Table ES-3: MISO West AFSIS Thermal Network Upgrades

Constraint	Owner	Mitigation	Cost (\$)
J976 POI-Enon Tap 345 kV	Ameren	upgraded by internal projects: SN/SE: 1836 / 2091MVA	\$0
J976 POI-Montgomery 345 kV	Ameren	DPP19 Central Upgrade: Upgrade 0.02 mi 345 kV line conductor from MTGY to Str 326 on MTGY-BELU-6 to be 3000 A, upgrade the Montgomery line position to be 3000A. No Cost to DISIS-2022-001	\$0

Transient stability analysis was performed to identify any transient stability violations caused by the SPP Study Projects in MISO West. Stability package representing 2026 summer peak (SPK) and summer shoulder (SH) scenarios with SPP DISIS 2022-001 Study Projects in MISO West was created from the MISO DPP 2021 West Phase 2 stability packages. Power flow models are the same as steady state power flow models

Transient stability analysis was performed to identify any transient stability violations caused by the SPP Study Projects in MISO West. No transient stability constraints were identified in the 2026 summer peak and summer shoulder scenarios. No MISO AFSIS stability NUs were identified in the transient stability analysis.

A short circuit screening analysis was conducted by comparing three phase fault currents in the benchmark and study cases for the SPP Study Projects in MISO West. Based on the screening results, MISO Transmission Owners do not plan to conduct additional studies.

Contingent prior queue upgrade facilities were identified for the SPP Study Projects in MISO West.

It should be noted that a restudy may be required if significant changes to the study assumptions occur, including but not limited to, interconnection request withdrawals and/or changes to higher-queued Network Upgrades included in the Base Case.

For the study projects that are required to mitigate thermal violations, the projects should not be allowed to come into service before the required Network Upgrades are in service, unless a MISO restudy removes the mitigation requirement from the project, or an interim limit is

**** DRAFT ****

provided to the project through MISO Annual ERIS process. For projects that are required to mitigate voltage violations, no injection is allowed until the allocated upgrades and contingent facilities are in service.

1.3 Total MISO AFSIS Network Upgrades

1.3.1 Total MISO AFSIS Network Upgrades for Study Projects in MISO South

The total cost of MISO AFSIS Network Upgrades required for the Study Projects in MISO South is listed in Table ES-4. The costs for Network Upgrades are planning level estimates and subject to be revised in the facility studies.

**Table ES-4: Total Cost of MISO AFSIS Network Upgrades for
SPP DISIS 2022-001 Study Projects in MISO South**

1.4 Per Project Summary

This section provides estimated cost of MISO AFSIS Network Upgrades on a per project basis for the Study Projects in SPP DISIS 2022-001 cycle.

It should be noted that a restudy may be required should significant changes to the study assumptions occur, including but not limited to, interconnection request withdrawals and/or changes to higher-queued Network Upgrades included in the Base Case.

1.4.1 Per Project Summary for Study Projects in MISO South

All DISIS 2022-001 generation projects in MISO South (Table ES-1) do not have MISO AFSIS Network Upgrade cost allocated to the projects

1.4.2 Per Project Summary for Study Projects in MISO West

All DISIS 2022-001 generation projects in MISO West (Table ES-2) do not have MISO AFSIS Network Upgrade cost allocated to the projects.

This page intentionally left blank.

Model Development and Study Criteria

1.1 MISO South Model Development and Study Criteria

1.1.1 MISO South Region AFSIS Model Development

Summer peak and summer shoulder steady state models and stability packages used for MISO AFSIS on SPP DISIS 2022-001 Study Projects in MISO South were developed from the MISO DPP 2021 South Phase 2 models and stability packages.

The starting models used for developing MISO South AFSIS models on DISIS 2022-001 Study are listed below:

- 2026 summer peak model: DPP21-Phase2-2026SUM-Dischrg-Final_240419.sav
- 2026 summer shoulder model: DPP21-Phase2-2026SSH-Dischrg-Final_240419.sav

1.1.1.1 MISO South AFSIS Benchmark Cases

The benchmark cases for the MISO South AFSIS study were created as follows:

- Removed recently withdrawn MISO South prior queued generation projects (Table A-1). Update MW output of J1851, J1856, J1870, J2153, J2261, J2287, and J2317 after their power reduction. Power mismatch was balanced by scaling generation in the MISO South (Table A-10).
- Removed recently withdrawn MISO Classic prior queued generation projects (Table A-2). Power mismatch was balanced by scaling generation in the MISO North (Table A-9).
- Removed recently withdrawn MPC prior queued generation projects (Table A-3). Power mismatch was balanced by scaling generation in the MISO North (Table A-9).
- Removed recently withdrawn SPP prior queued generation projects (Table A-4). Corrected generation dispatch for several SPP prior queued projects. Power mismatch was balanced by scaling generation in SPP market (Table A-11) based on the load-ratio share of the Transmission Owner (TO) power flow modeling areas.
- SPP prior queued generation projects (Table A-5) were modeled.
- Removed several SPP Network Upgrades associated with SPP prior queued withdrawn projects. Added SPP R PLAN "BUILD GENTLEMAN - CHERRY COUNTY - HOLT 345kV". Power mismatch was balanced by scaling generation in SPP market (Table A-11) based on the load-ratio share of the TO power flow modeling areas.
- Removed withdrawn AECl prior queued generation projects GIA-84, GIA-099, GIA-100, and GIA-105. AECl prior queued generation projects (Table A-6) were modeled. Power mismatch was balanced by scaling generation in AECl (Table A-12).

**** DRAFT ****

- Removed recently retired MISO generation in MISO South area. These recently retired MISO South generation are listed in Table A-7. Power mismatch was balanced by scaling generation in the MISO South (Table A-10).
- Removed recently retired MISO generation in MISO Central area. These recently retired generation projects in MISO Central are listed in Table A-8. Power mismatch was balanced by scaling generation in the MISO North (Table A-9).
- Turned off MISO generation projects in DPP 2021 Central area due to their lower queue positions. Power mismatch was balanced by scaling generation in the MISO North (Table A-9).
- Added the SPP Study Projects with offline status in DISIS 2022-001 cycles close to MISO South. The SPP Study Projects in MISO South are listed in Table ES-1.

1.1.1.2 MISO South AFSIS Study Cases

Summer peak (SPK) study case was created by dispatching the Study Projects in MISO South at the specified summer peak level from the benchmark case.

Summer shoulder (SH) study case was created by dispatching the Study Projects in MISO South at the specified summer shoulder level from the benchmark case.

Generation in the SPP market was used for power balance, where SPP generation was scaled based on the load-ratio share of the TO power flow modeling areas.

Both study and benchmark power flow cases were solved with transformer tap adjustment enabled, area interchange disabled, phase shifter adjustment enabled and switched shunt adjustment enabled.

1.1.2 MISO South Region AFSIS Contingency Criteria

The following contingencies were considered in the MISO South AFSIS analysis:

- NERC Category P0 (system intact - no contingencies)
- NERC Category P1 contingencies
 - Single element outages, at buses with a nominal voltage of 60 kV and above.
 - Multiple-element NERC Category P1 contingencies.
 - NERC Category P2, P4, P5, P7 contingencies.

The detailed list of contingency files is in Appendix A.9

For all contingency and post-disturbance analyses, cases were solved with transformer tap adjustment enabled, area interchange adjustment disabled, phase shifter adjustment disabled (fixed) and switched shunt adjustment enabled.

1.1.3 MISO South Region AFSIS Monitored Elements

The MISO South AFSIS study area is defined in Table 1-1. Facilities in the study area were monitored for system intact and contingency conditions. Under NERC category P0 conditions (system intact), branches were monitored for loading above the normal (PSS®E rate A) rating, and bus voltages were monitored based on normal voltage limits associated with each bus in power flow case. Under NERC category P1-P7 conditions, branches were monitored for loading as shown in the column labeled "Post-Disturbance Thermal Limits", and bus

voltages were monitored based on emergency voltage limits associated with each bus in power flow case.

Table 1-1: MISO South AFSIS Monitored Elements

Owner / Area	Thermal Limits ¹	
	Pre-Disturbance	Post-Disturbance
EES	100% of Rate A	100% of Rate B
CLECO	100% of Rate A	100% of Rate B
SMEPA	100% of Rate A	100% of Rate B
LAFA	100% of Rate A	100% of Rate B
LAGN	100% of Rate A	100% of Rate B
LEPA	100% of Rate A	100% of Rate B

1.2 MISO West Model Development and Study Criteria

1.2.1 MISO West Region AFSIS Model Development

Summer peak and summer shoulder steady state models and stability packages used for MISO AFSIS on SPP DISIS 2022-001 Study Projects in MISO West were developed from the MISO DPP 2021 West Phase 2 models and stability packages.

The starting models used for developing MISO West AFSIS models on DISIS 2022-001 Study are listed below:

- 2026 summer peak model: DPP21-Ph2-2026SUM-Study-Discharge_Final_01222024_V2.sav
- 2026 summer shoulder model: DPP21-Ph2-2026SHHW-Study-Discharge_Final_01222024_V2.sav

1.2.1.1 MISO West AFSIS Benchmark Cases

The benchmark cases for the MISO West AFSIS study were created as follows:

- Removed recently withdrawn MISO North and CIPCO prior queued generation projects (Table B-1). Power mismatch was balanced by scaling generation in the MISO North (Table A-9).
- Removed recently withdrawn SPP prior queued generation projects (Table B-2). Removed duplicated projects GEN-2017-060, GEN-2017-082. Corrected generation dispatch for several SPP prior queued projects. Power mismatch was balanced by scaling generation in SPP market (Table A-11) based on the load-ratio share of the TO power flow modeling areas.
- SPP prior queued generation projects (Table B-3) were modeled

**** DRAFT ****

- Removed several SPP Network Upgrades associated with SPP prior queued withdrawn projects. Added SPP R PLAN "BUILD GENTLEMAN - CHERRY COUNTY - HOLT 345kV". Power mismatch was balanced by scaling generation in SPP market (Table A-11) based on the load-ratio share of the TO power flow modeling areas
- Removed withdrawn Network Upgrade Astoria-Brookings 345 kV line. Network Upgrades for prior queued projects and MTEP Appendix A projects were added into the models. They are listed in Table B-4.
- Removed withdrawn MPC project MPC04300. MPC prior queued generation projects (Table B-5) were modeled. Power mismatch was balanced by scaling generation in the MISO North (Table A-9) except generation in Dakotas.
- Removed withdrawn AECl prior queued generation project GIA-84, GIA-099, GIA-100, GIA-105, GIA-106, and GIA-107. AECl prior queued generation projects (Table B-6) were modeled. Power mismatch was balanced by scaling generation in AECl (Table A-12).
- Removed recently retired MISO generation in MISO West and Central areas. These recently retired MISO West and Central generation are listed in Table B-7. Power mismatch was balanced by scaling generation in the MISO North (Table A-9).
- Turned off MISO generation projects in DPP 2021 Central area due to their lower queue positions. Power mismatch was balanced by scaling generation in the MISO North (Table A-9).
- Added the SPP Study Projects with offline status in DISIS 2022-001 cycles close to MISO West. The SPP Study Projects in MISO West are listed in Table ES-2.

1.2.1.2 MISO West AFSIS Study Cases

Summer peak (SPK) study case was created by dispatching the Study Projects in MISO West at the specified summer peak level from the benchmark case.

Summer shoulder (SH) study case was created by dispatching the Study Projects in MISO West at the specified summer shoulder level from the benchmark case.

Generation in the SPP market was used for power balance, where SPP generation was scaled based on the load-ratio share of the TO power flow modeling areas.

Due to potential voltage collapse in SPP system, one fictitious SVC was added to the summer peak study model. Several 345 kV line reactors were also switched off. These changes are listed in Table B-8.

Both study and benchmark power flow cases were solved with transformer tap adjustment enabled, area interchange disabled, phase shifter adjustment enabled and switched shunt adjustment enabled.

1.2.2 MISO West Region AFSIS Contingency Criteria

The following contingencies were considered in the MISO West AFSIS analysis:

- NERC Category P0 (system intact - no contingencies)
- NERC Category P1 contingencies
 - Single element outages, at buses with a nominal voltage of 60 kV and above.
 - Multiple-element NERC Category P1 contingencies.

- NERC Category P2, P4, P5, P7 contingencies.

The detailed list of contingency files is in Appendix B.8.

For all contingency and post-disturbance analyses, cases were solved with transformer tap adjustment enabled, area interchange adjustment disabled, phase shifter adjustment disabled (fixed) and switched shunt adjustment enabled.

1.2.3 MISO West Region AFSIS Monitored Elements

The MISO West AFSIS study area is defined in Table 1-2. Facilities in the study area were monitored for system intact and contingency conditions. Under NERC category P0 conditions (system intact), branches were monitored for loading above the normal (PSS[®]E rate A) rating, and bus voltages were monitored based on normal voltage limits associated with each bus in power flow case. Under NERC category P1-P7 conditions, branches were monitored for loading as shown in the column labeled "Post-Disturbance Thermal Limits", and bus voltages were monitored based on emergency voltage limits associated with each bus in power flow case.

Table 1-2: MISO West AFSIS Monitored Elements

Owner / Area	Thermal Limits ¹

1.3 MISO Steady State Performance Criteria

A branch is considered as a thermal injection constraint if the branch is loaded above its applicable normal or emergency rating for the post-change case, and any of the following conditions are met:

- 1) the generator (NR/ER) has a larger than 20% DF on the overloaded facility under post contingent condition or 5% DF under system intact condition, or
- 2) the megawatt impact due to the generator is greater than or equal to 20% of the applicable rating (normal or emergency) of the overloaded facility, or
- 3) the overloaded facility or the overload-causing contingency is at generator's outlet, or
- 4) for any other constrained facility, where none of the study generators meet one of the above criteria in 1), 2), or 3), however, the cumulative megawatt impact of the group of study generators (NR/ER) is greater than 20% of the applicable rating, then only those study generators whose individual MW impact is greater than 5% of the applicable rating and has DF greater than 5% (OTDF or PTDF) will be responsible for mitigating the cumulative MW impact constraint.

A bus is considered a voltage constraint if both of the following conditions are met. All voltage constraints must be resolved before a project can receive interconnection service.

- 1) the bus voltage is outside of applicable normal or emergency limits for the post-change case, and
- 2) the change in bus voltage is greater than 0.01 per unit.

All Study Projects must mitigate thermal injection constraints and voltage constraints in order to obtain unconditional Interconnection Service.

Section**2**

MISO South Affected System Study

Steady state thermal and voltage analysis and transient stability analysis were performed in the MISO South AFSIS study.

2.1 MISO South AFSIS Thermal and Voltage Analysis

Nonlinear (AC) contingency analysis was performed on the benchmark and study cases, and the incremental impact of the SPP DISIS 2022-001 Study Projects in MISO South were evaluated by comparing the steady-state performance of the transmission system in the benchmark and study cases. Network upgrades were identified to mitigate any steady state thermal and voltage constraints.

Steady-state analysis was performed in summer peak and summer shoulder discharging scenarios. PSS®E version 34.9.5 and TARA were used in the study.

2.1.1 MISO Contingency Analysis for 2026 Summer Peak Condition

Steady state AC contingency analysis was performed on the MISO South AFSIS summer peak (SPK) study and benchmark cases developed in Section 1.1.1. The 2026 summer peak MISO thermal and voltage results are in Appendix C.1.

2.1.1.1 Summer Peak System Intact Conditions

For NERC category P0 (system intact) conditions, no thermal constraints (Table C-1) or voltage constraints (Table C-2) were identified.

2.1.1.2 Summer Peak Post Contingency Conditions

The results in this Section are for analysis of conditions following NERC category P1-P7 contingencies.

For P1 contingencies, no thermal constraints (Table C-3) or voltage constraints (Table C-4) were identified.

For P2-P7 contingencies, no thermal constraints (Table C-5) or voltage constraints (Table C-6) were identified.

2.1.1.3 Summary of Summer Peak Results

In summer peak scenario, no thermal constraints or voltage constraints were identified in MISO South AFSIS.

2.1.2 MISO Contingency Analysis for 2026 Summer Shoulder Condition

Steady state AC contingency analysis was performed on the MISO South AFSIS summer shoulder (SH) study and benchmark cases developed in Section 1.1.1. The 2026 summer shoulder MISO thermal and voltage results are in Appendix C.2.

2.1.2.1 Summer Shoulder System Intact Conditions

For NERC category P0 (system intact) conditions, no thermal constraints (Table C-7) or voltage constraints (Table C-8) were identified.

2.1.2.2 Summer Shoulder Post Contingency Conditions

The results in this Section are for analysis of conditions following NERC category P1-P7 contingencies.

For P1 contingencies, no thermal constraints (Table C-9) or voltage constraints (Table C-10) were identified.

For P2-P7 contingencies, no thermal constraints (Table C-11) or voltage constraints (Table C-12) were identified.

2.1.2.3 Summary of Summer Shoulder Results

In summer shoulder scenario, no thermal constraints or voltage constraints were identified in MISO South AFSIS.

2.1.3 Summary of MISO South AFSIS Steady State Analysis

MISO South steady state analyses were performed on the MISO 2026 summer peak and summer shoulder scenarios. no thermal constraints or voltage constraints were identified.

2.2 MISO South AFSIS Transient Stability Analysis

Stability analysis was performed to evaluate transient stability and impact on the MISO South region of the SPP Study Projects in MISO South.

2.2.1 Procedure

2.2.1.1 Computer Programs

Stability analysis was performed using TSAT revision 23.0.

2.2.1.2 Methodology

Stability package representing 2026 summer peak (SPK) and summer shoulder (SH) scenarios with SPP DISIS 2022-001 Study Projects in MISO South was created from the MISO DPP 2021 South Phase 2 stability packages. Power flow models are the same as steady state power flow models, which were developed in Section 1.1.1.

Disturbances were simulated to evaluate the transient stability and impact on the region of the SPP Study Projects in MISO South. MISO transient stability criteria and local TOs' planning criteria specified in MTEP21 were adopted for checking stability violations.

2.2.2 Model Development

Summer peak and summer shoulder stability power flow models are the same as the correspondent steady state models, which were developed as specified in Section 1.1.1.

2.2.3 Disturbance Criteria

The stability simulations performed as part of this study considered all the regional and local contingencies listed in Table 2-1. Regional contingencies with pre-defined switching sequences were selected from the MISO MTEP21 study; switching sequences for local contingencies were developed based on the generic clearing times shown in Table 2-2. The admittance for local single line-to-ground (SLG) faults were estimated by assuming that the Thevenin impedance of the positive, negative and zero sequence networks at the fault point are equal.

Table 2-1: MISO South AFSIS Regional and Local Disturbance Descriptions

CEII Redacted

Table 2-2: Generic Clearing Time Assumption

Voltage Level (kV)	Primary Clearing Time (cycle)	Backup Clearing Time (cycle)
345 kV	4	11
230 kV	5	13
161/138 kV	6	18
115 kV	6	20
69 kV	8	24

2.2.4 Performance Criteria

MISO transient stability criteria and local TOs' planning criteria specified in MTEP21 were adopted. The Study Projects must mitigate the stability constraints to obtain any type of Interconnection Service.

2.2.5 Summer Peak Stability Results

The contingencies listed in Table 2-1 were simulated using the summer peak stability model.

Appendix D.1.2 contains plots of generator rotor angles, generator power output, and bus voltages for each simulation. Simulations were performed with a 0.5 seconds steady-state run followed by the appropriate disturbance. Simulations were run for a 10-second duration.

MISO South AFSIS summer peak stability study results summary is in Appendix D.1.1, Table D-1.

The following stability related issues were identified in the summer peak stability study.

2.2.5.1 Generator Tripping Due to Low Voltage Relay

Under several faults, some generators were tripped by their low voltage relays (Table 2-3). Duration of the faults is longer than low voltage relay tripping time. Therefore, no mitigation is required for these generators tripping.

Table 2-3: Generator Tripping Due to Low Voltage Relay

CEII Redacted

2.2.5.2 Stability Network Upgrades Identified in Summer Peak

In summary, no MISO Affected System stability constraints were identified in the summer peak scenario. No MISO AFSIS stability NUs are required in summer peak stability study.

2.2.6 Summer Shoulder Stability Results

The contingencies listed in Table 2-1 were simulated using the summer shoulder stability model.

Appendix D.2.2 contains plots of generator rotor angles, generator power output, and bus voltages for each simulation. Simulations were performed with a 0.5 seconds steady-state run followed by the appropriate disturbance. Simulations were run for a 10-second duration.

MISO South AFSIS summer shoulder stability study results summary is in Appendix D.2.1, Table D-2.

The following stability related issues were identified in the summer shoulder stability study.

2.2.6.1 Generator Tripping Due to Low Voltage Relay

Under several faults, some generators were tripped by their low voltage relays (Table 2-4). Duration of the faults is longer than low voltage relay tripping time. Therefore, no mitigation is required for these generators tripping.

Table 2-4: Generator Tripping Due to Low Voltage Relay

CEII Redacted

2.2.6.2 Stability Network Upgrades Identified in Summer Shoulder

In summary, no MISO Affected System stability constraints were identified in the summer shoulder scenario. No MISO AFSIS stability NUs are required in summer shoulder stability study.

2.2.7 Summary of MISO South AFSIS Transient Stability Analysis

Based on the MISO South 2026 summer peak and summer shoulder transient stability analysis, no MISO South AFSIS stability NUs are required for the SPP Study Projects in MISO South.

MISO West Affected System Study

Steady state thermal and voltage analysis and transient stability analysis were performed in the MISO West AFSIS study.

3.1 MISO West AFSIS Thermal and Voltage Analysis

Nonlinear (AC) contingency analysis was performed on the benchmark and study cases, and the incremental impact of the SPP DISIS 2022-001 Study Projects in MISO West were evaluated by comparing the steady-state performance of the transmission system in the benchmark and study cases. Network upgrades were identified to mitigate any steady state thermal and voltage constraints.

Steady-state analysis was performed in summer peak and summer shoulder discharging scenarios. PSS®E version 34.9.5 and TARA were used in the study.

3.1.1 MISO Contingency Analysis for 2026 Summer Peak Condition

Steady state AC contingency analysis was performed on the MISO West AFSIS summer peak (SPK) study and benchmark cases developed in Section 1.2.1. The 2026 summer peak MISO thermal and voltage results are in Appendix E.1.

3.1.1.1 Summer Peak System Intact Conditions

For NERC category P0 (system intact) conditions, no thermal constraints (Table E-1) or voltage constraints (Table E-2) were identified.

3.1.1.2 Summer Peak Post Contingency Conditions

The results in this Section are for analysis of conditions following NERC category P1-P7 contingencies. All NERC Category P1 contingencies were converged.

For P1 contingencies, no thermal constraints (Table E-3) or voltage constraints (Table E-4) were identified.

For P2-P7 contingencies, no thermal constraints (Table E-5) or voltage constraints (Table E-6) were identified.

3.1.1.3 Summary of Summer Peak Results

In summer peak scenario, no thermal or voltage constraints were identified in the MISO West steady state analysis for the SPP Study Projects.

**** DRAFT ****

3.1.2 MISO Contingency Analysis for 2026 Summer Shoulder Condition

Steady state AC contingency analysis was performed on the MISO West AFSIS summer shoulder (SH) study and benchmark cases developed in Section 1.2.1. The 2026 summer shoulder MISO thermal and voltage results are in Appendix E.2.

3.1.2.1 Summer Shoulder System Intact Conditions

For NERC category P0 (system intact) conditions, thermal constraints are listed in Table E-7. No voltage constraints were identified (Table E-8).

3.1.2.2 Summer Shoulder Post Contingency Conditions

The results in this Section are for analysis of conditions following NERC category P1-P7 contingencies.

For P1 contingencies, thermal constraints are listed in Table E-9. No voltage constraints were identified (Table E-10).

One category P1-P7 contingencies (Table E-13) was not converged in both the benchmark and study cases. No mitigation plan is required for the SPP Study Projects for this non-converged contingency.

For the non-converged contingencies in Table E-13, DC contingency analysis was performed to get the dc thermal results. The dc thermal results for non-converged contingencies are listed in Table E-14.

For P2-P7 contingencies, no thermal constraints (Table E-11) or voltage constraints (Table E-12) were identified.

3.1.2.3 Summer Shoulder Worst Constraints

In the 2026 summer shoulder scenario, MISO West AFSIS worst thermal constraints are listed in Table 3-1. No voltage constraints were identified.

3.1.2.4 Summary of Summer Shoulder Results

In the summer shoulder scenario, Table 3-2 lists MISO West AFSIS thermal constraints and Network Upgrades. No voltage constraints were identified.

Table 3-1: 2026 Summer Shoulder MISO West AFSIS Thermal Constraints, Maximum Screened Loading

Generator	Constraint	Rating	Owner	Worst Loading		Contingency	Cont Type
				(MVA)	(%)		
GEN-2022-100	J976 POI-Enon Tap 345 kV	956.0	Ameren	978.6	102.4	CEII Redacted	P0

GEN-2022-100	J976 POI-Montgomery 345 kV	Ameren	DPP19 Central Upgrade: Upgrade 0.02 mi 345 kV line conductor from MTGY to Str 326 on MTGY-BELU-6 to be 3000 A, upgrade the Montgomery line position to be 3000A. No Cost to DISIS-2022-001	\$0

3.1.3 Summary of MISO West AFSIS Steady State Analysis

MISO West steady state analyses were performed on the MISO 2026 summer peak and summer shoulder scenarios. No thermal or voltage constraints were identified in the summer peak scenario. In the summer shoulder scenario, steady state thermal constraints and required Network Upgrades are listed in Table 3-2; No voltage constraints were identified.

3.2 MISO West AFSIS Transient Stability Analysis

Stability analysis was performed to evaluate transient stability and impact on the MISO West region of the SPP Study Projects in MISO West.

3.2.1 Procedure

3.2.1.1 Computer Programs

Stability analysis was performed using TSAT revision 24.0.

3.2.1.2 Methodology

Stability package representing 2026 summer peak (SPK) and summer shoulder (SH) scenarios with SPP DISIS 2022-001 Study Projects in MISO West was created from the MISO DPP 2021 West Phase 2 stability packages. Power flow models are the same as steady state power flow models, which were developed in Section 1.2.1.

Disturbances were simulated to evaluate the transient stability and impact on the region of the SPP Study Projects in MISO West. MISO transient stability criteria and local TOs' planning criteria specified in MTEP21 were adopted for checking stability violations.

3.2.2 Model Development

Summer peak and summer shoulder stability power flow models are the same as the correspondent steady state models, which were developed as specified in Section 1.2.1.

3.2.3 Disturbance Criteria

The stability simulations performed as part of this study considered all the regional and local contingencies listed in Table 3-3. Regional contingencies with pre-defined switching sequences were selected from the MISO MTEP21 study; switching sequences for local contingencies were developed based on the generic clearing times shown in Table 2-2. The admittance for local single line-to-ground (SLG) faults were estimated by assuming that the Thevenin impedance of the positive, negative and zero sequence networks at the fault point are equal.

Table 3-3: MISO West AFSIS Regional and Local Disturbance Descriptions**CEII Redacted**

3.2.4 Performance Criteria

MISO transient stability criteria and local TOs' planning criteria specified in MTEP21 were adopted. The Study Projects must mitigate the stability constraints to obtain any type of Interconnection Service.

3.2.5 Summer Peak Stability Analysis

The contingencies listed in Table 3-3 were simulated using the summer peak stability model. The summer peak stability model was developed from the summer peak steady state model. As mentioned in Section 1.2.1.2, one fictitious SVC was added and several 345 kV line reactors were also switched off (Table B-8) in summer peak study case due to potential voltage collapse in SPP system.

3.2.5.1 Stability Results in Summer Peak Scenario

Appendix F.1.2 contains plots of generator rotor angles, generator power output, and bus voltages for each simulation. Simulations were performed with a 0.5 seconds steady-state run followed by the appropriate disturbance. Simulations were run for a 10-second duration.

MISO West AFSIS summer peak stability study results summary is in Appendix F.1.1, Table F-1.

Under all the simulated faults, simulations are transiently stable, transient period voltage criteria are met, oscillations are well damped. No stability constraints were identified..

3.2.5.2 Stability Network Upgrades Identified in Summer Peak

In summary, no MISO Affected System stability constraints were identified in the summer peak scenario. No MISO AFSIS stability NUs are required in summer peak stability study.

3.2.6 Summer Shoulder Stability Analysis

The contingencies listed in Table 3-3 were simulated using the summer shoulder stability model. The summer shoulder stability model was developed from the summer shoulder steady state model. As mentioned in Section 1.2.1.2, several 345 kV line reactors were switched off (Table B-8) in summer shoulder study case due to low voltages in SPP system.

3.2.6.1 Stability Results in Summer Shoulder Scenario

Appendix F.2.2 contains plots of generator rotor angles, generator power output, and bus voltages for each simulation. Simulations were performed with a 0.5 seconds steady-state run followed by the appropriate disturbance. Simulations were run for a 10-second duration.

MISO West AFSIS summer shoulder stability study results summary is in Appendix F.2.1, Table F-2.

**** DRAFT ****

MISO West Affected System Study

Under all the simulated faults, simulations are transiently stable, transient period voltage criteria are met, oscillations are well damped. No stability constraints were identified..

3.2.6.2 Stability Network Upgrades Identified in Summer Shoulder

In summary, no MISO Affected System stability constraints were identified in the summer shoulder scenario. No MISO AFSIS stability NUs are required in summer shoulder stability study.

3.2.7 Summary of MISO West AFSIS Transient Stability Analysis

Based on the MISO West 2026 summer peak and summer shoulder transient stability analysis, no MISO West AFSIS stability NUs are required for the SPP Study Projects in MISO West.

Contingent Facilities

4.1 Contingent Facilities in MISO South

No contingent MTEP facilities were identified for the SPP Study Projects in MISO South.

4.2 Contingent Facilities in MISO West

Contingent prior queue upgrade facilities were identified for the SPP Study Projects in MISO West, which are listed in Table 4-1.

Table 4-1: Contingent Facilities in MISO West

MTEP ID	MTEP Cycle	Facility Name	Description	Expected ISD	Status	Conditional Projects
TBD	TBD	J976 POI-Montgomery 345 kV	DPP19 Central Upgrade: Upgrade 0.02 mi 345 kV line conductor from MTGY to Str 326 on MTGY-BELU-6 to be 3000 A, upgrade the Montgomery line position to be 3000A,	TBD	TBD	GEN-2022-100

Network Upgrades and Cost Allocation

5.1 Cost Assumptions for Network Upgrades

The cost estimate for each network upgrade was provided by the corresponding transmission owning company.

5.2 Cost Allocation Methodology

Costs of AFSIS Network Upgrades are allocated based on MISO Network Upgrade cost allocation methodology, which is detailed in the MISO Generation Interconnection Business Practices Manual BPM-015.

5.3 MISO South AFSIS Network Upgrades Required for the SPP Study Projects in MISO South

5.3.1 MISO South AFSIS Network Upgrades

Based on the MISO South 2026 summer peak and summer shoulder steady state analysis, no thermal constraints or voltage constraints were identified in MISO system for the SPP Study Projects in MISO South. No MISO AFSIS thermal or voltage Network Upgrades were identified.

Based on the MISO South 2026 summer peak and summer shoulder transient stability analysis, no transient stability constraints were identified for the SPP Study Projects in MISO South; No MISO South AFSIS stability NUs are required for the SPP Study Projects in MISO South.

A short circuit screening analysis was conducted by comparing three phase fault currents in the benchmark and study cases for the SPP Study Projects in MISO South. Based on the screening results, MISO Transmission Owners do not plan to conduct additional studies.

No contingent MTEP facilities were identified for the SPP Study Projects in MISO South.

The total costs of MISO South AFSIS Network Upgrades for SPP Study Projects in MISO South are summarized in Table 5-1.

It should be noted that a restudy may be required if significant changes to the study assumptions occur, including but not limited to, interconnection request withdrawals and/or changes to higher-queued Network Upgrades included in the Base Case.

For the study projects that are required to mitigate thermal violations, the projects should not be allowed to come into service before the required Network Upgrades are in service, unless a MISO restudy removes the mitigation requirement from the project, or an interim limit is

**** DRAFT ****

provided to the project through MISO Annual ERIS process. For projects that are required to mitigate voltage violations, no injection is allowed until the allocated upgrades and contingent facilities are in service.

Table 5-1: Summary of MISO South AFSIS Network Upgrades

Category of Network Upgrades	Cost (\$)
Thermal Network Upgrades Identified in MISO Steady-State Analysis	\$0

5.4 MISO West AFSIS Network Upgrades Required for the SPP Study Projects in MISO West

5.4.1 MISO West AFSIS Network Upgrades

Based on the MISO West 2026 summer peak and summer shoulder steady state analysis, thermal constraints were identified in MISO system for the SPP Study Projects in MISO West; No voltage constraints were identified in MISO West. The thermal constraints can be

**** DRAFT ****

mitigated by Network Upgrades required for prior queued projects. No MISO West AFSIS steady state Network Upgrades are required for the SPP Study Projects in MISO West.

Based on the MISO West 2026 summer peak and summer shoulder transient stability analysis, no transient stability constraints were identified for the SPP Study Projects in MISO West; No MISO West AFSIS stability NUs are required for the SPP Study Projects in MISO West.

A short circuit screening analysis was conducted by comparing three phase fault currents in the benchmark and study cases for the SPP Study Projects in MISO West. Based on the screening results, MISO Transmission Owners do not plan to conduct additional studies.

Contingent prior queue upgrade facilities were identified for the SPP Study Projects in MISO West.

The total costs of MISO West AFSIS Network Upgrades for SPP Study Projects in MISO West are summarized in Table 5-7.

Table 5-7: Summary of MISO West AFSIS Network Upgrades

Category of Network Upgrades	Cost (\$)
Thermal Network Upgrades Identified in MISO Steady-State Analysis	\$0
Voltage Network Upgrades Identified in MISO Steady-State Analysis	\$0
Network Upgrades Identified in Stability Analysis	\$0
Network Upgrades Identified in Short Circuit Analysis	\$0
Total	\$0

MISO West AFSIS Network Upgrades for SPP Study Projects in MISO West are listed below.

It should be noted that a restudy may be required if significant changes to the study assumptions occur, including but not limited to, interconnection request withdrawals and/or changes to higher-queued Network Upgrades included in the Base Case.

For the study projects that are required to mitigate thermal violations, the projects should not be allowed to come into service before the required Network Upgrades are in service, unless a MISO restudy removes the mitigation requirement from the project, or an interim limit is provided to the project through MISO Annual ERIS process. For projects that are required to mitigate voltage violations, no injection is allowed until the allocated upgrades and contingent facilities are in service.

Table 5-8: MISO West Thermal NUs and Cost

Constraint	Owner	Mitigation	Cost (\$)
J976 POI-Enon Tap 345 kV	Ameren	upgraded by internal projects: SN/SE: 1836 / 2091MVA	\$0
J976 POI-Montgomery 345 kV	Ameren	DPP19 Central Upgrade: Upgrade 0.02 mi 345 kV line conductor from MTGY to Str 326 on MTGY-BELU-6 to be 3000 A, upgrade the Montgomery line position to be 3000A. No Cost to DISIS-2022-001	\$0

Table 5-9: MISO West Steady-State Voltage NUs and Cost

Network Upgrades	Owner	Study Cycle	Cost (\$)
No voltage NUs			\$0

Table 5-10: MISO West Transient Stability NUs and Cost

Network Upgrades	Owner	Cost (\$)
No MISO AFS stability NUs		\$0

Table 5-11: MISO West Short Circuit Network Upgrades

NUs	Cost (\$)
No short circuit NUs	\$0

5.4.2 MISO West AFSIS NU Cost Allocation

Assuming all generation projects in the SPP Study Projects in MISO West advance, a summary of the costs for total MISO West AFSIS NUs allocated to each generation project is listed in Table 5-12.

Table 5-12: Summary of MISO West AFSIS NU Costs Allocated to the SPP West Study Projects

MISO South AFSIS Stability Analysis Results

D.1 2026 Summer Peak (SPK) MISO South AFSIS Stability Results

Stability simulation was performed in the 2026 summer peak (SPK) stability model.

D.1.1 2026 SPK MISO South AFSIS Stability Summary

MISO South AFSIS summer peak stability study results are summarized in Table D-1.

Table D-1: 2026 Summer Peak MISO South AFSIS Stability Analysis Results Summary

Cell Redacted

**** DRAFT ****

MISO South AFSIS Stability Analysis Results

D.1.2 2026 SPK MISO South AFSIS Stability Plots

Plots of stability simulations for 2026 summer peak study case are in separate files which are listed below:

AppendixD1-2_2026SPK_SPP South Ph3_Study_Plots.zip

CEII Redacted

**** DRAFT ****

MISO South AFSIS Stability Analysis Results

D.2 2026 Summer Shoulder MISO South AFSIS Stability Results

Stability simulation was performed in the 2026 summer shoulder (SH) stability model.

D.2.1 2026 SH MISO South AFSIS Stability Summary

MISO South AFSIS summer shoulder stability study results are summarized in Table D-2.

Table D-2: 2026 Summer Shoulder MISO South AFSIS Stability Analysis Results Summary

CEII Redacted

D.2.2 2026 SH MISO South AFSIS Stability Plots

Plots of stability simulations for 2026 summer shoulder study case are in separate files which are listed below:

AppendixD2-2_2026SH_SPP South Ph3_Study_Plots.zip
